Hipotrikozis 1, 605389; HYPT1 (Hipotrikozis Simpleks) (APCDD1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis 1, 605389; HYPT1 (Hypotrichosis simplex) (APCDD1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	APCDD1	APCDD1, HHS, HYPT1, HTS	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypotrichosis 1 (HYPT1) [MIM:605389]: A rare form of non- syndromic hereditary hypotrichosis without characteristic hair shaft anomalies. Affected individuals typically show normal hair at birth, but hair loss and thinning of the hair shaft start during early childhood and progress with age. {ECO:0000269	PubMed:20393562}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Hipotrikozis 11, 615059, Otozomal Dominant; HYPT11 (Hipotrikozis Simpleks) (SNRPE geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis 11, 615059, Autosomal dominant; HYPT11 (Hypotrichosis simplex) (SNRPE gene) (Sequence Analysis-All Coding Exons) (Postnatal)	SNRPE	SNRPE, HYPT11	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
Hipotrikozis 12, 615885, Otozomal Dominant; HYPT12 (Hipotrikozis Simpleks) (RPL21 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis 12, 615885, Autosomal dominant; HYPT12 (Hypotrichosis simplex) (RPL21 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	RPL21	RPL21, HYPT12	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypotrichosis 12 (HYPT12) [MIM:615885]: A form of hypotrichosis, a condition characterized by the presence of less than the normal amount of hair and abnormal hair follicles and shafts, which are thin and atrophic. The extent of scalp and body hair involvement can be very variable, within as well as between families. HYPT12 patients have normal scalp hair density at birth. Hair loss begins during the first 6 months of life and gradually progresses to nearly complete loss of scalp hair. The remaining hairs grow slowly and are thin, sparse, dry, and fragile. Body hair, axillary and pubic hair, eyebrows and eyelashes are also sparse or absent. {ECO:0000269	PubMed:21412954}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Hipotrikozis 13, 615896, Otozomal Dominant; HYPT13 (Yünsü Saçlar) (KRT71 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis 13, 615896, Autosomal dominant; HYPT13 (Woolly hair) (KRT71 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	KRT71	KRT71, K6IRS1, KRT6IRS1, HYPT13	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypotrichosis 13 (HYPT13) [MIM:615896]: A form of hypotrichosis, a condition characterized by the presence of less than the normal amount of hair and abnormal hair follicles and shafts, which are thin and atrophic. The extent of scalp and body hair involvement can be very variable, within as well as between families. HYPT13 is characterized by sparse woolly hair. {ECO:0000269	PubMed:22592156}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Hipotrikozis 2, 146520, Otozomal Dominant; HYPT2 (Kafa Derisi Hipotrikozis Simpleks) (CDSN geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis 2, 146520, Autosomal dominant; HYPT2 (Hypotrichosis simplex of the scalp) (CDSN gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CDSN	CDSN, HTSS1, HYPT2, PSS1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypotrichosis 2 (HYPT2) [MIM:146520]: A condition characterized by the presence of less than the normal amount of hair. Affected individuals have normal hair in early childhood but experience progressive hair loss limited to the scalp beginning in the middle of the first decade and almost complete baldness by the third decade. Body hair, beard, eyebrows, axillary hair, teeth, and nails develop normally. {ECO:0000269	PubMed:12754508}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Hipotrikozis 3, 613981; HYPT3 (Kafa Derisi Hipotrikozis Simpleks) (KRT74 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis 3, 613981; HYPT3 (Hypotrichosis simplex of the scalp) (KRT74 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	KRT74	KRT74, K6IRS4, KRT6IRS4, HTSS2, HYPT3, ADWH	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypotrichosis 3 (HYPT3) [MIM:613981]: A condition characterized by the presence of less than the normal amount of hair. Affected individuals have normal hair in early childhood but experience progressive hair loss limited to the scalp beginning in the middle of the first decade and almost complete baldness by the third decade. Body hair, beard, eyebrows, axillary hair, teeth, and nails develop normally. {ECO:0000269	PubMed:21188418}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Hipotrikozis 4, 146550, Otozomal Dominant; HYPT4 (Marie Unna Kalıtsal Hipotrikozis) (HR geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis 4, 146550, Autosomal dominant; HYPT4 (Marie Unna hereditary hypotrichosis) (HR gene) (Sequence Analysis-All Coding Exons) (Postnatal)	HR	HR, AU, MUHH1, HYPT4	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypotrichosis 4 (HYPT4) [MIM:146550]: An autosomal dominant condition characterized by reduced amount of hair, alopecia, little or no eyebrows, eyelashes or body hair, and coarse, wiry, twisted hair in early childhood. {ECO:0000269|PubMed:19122663, ECO:0000269|PubMed:24961381}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Hipotrikozis 6, 607903, Otozomal Resesif; HYPT6 (Hipotrikozis Simpleks) (DSG4 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis 6, 607903, Autosomal recessive; HYPT6 (Hypotrichosis simplex) (DSG4 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	DSG4	DSG4, LAH, HYPT6	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypotrichosis 6 (HYPT6) [MIM:607903]: A condition characterized by the presence of less than the normal amount of hair and abnormal hair follicles and shafts, which are thin and atrophic. The disorder affects the trunk and extremities as well as the scalp, and the eyebrows and eyelashes may also be involved, whereas beard, pubic, and axillary hairs are largely spared. In addition, patients can develop hyperkeratotic follicular papules, erythema, and pruritus in affected areas. In some patients with congenital hypotrichosis, monilethrix-like hairs showing elliptical nodes have been observed. {ECO:0000269	PubMed:15191570}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Hipotrikozis 7, 604379, Otozomal Resesif; HYPT7 (Yünsü Saçlar) (LIPH geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis 7, 604379, Autosomal recessive; HYPT7 (Woolly hair) (LIPH gene) (Sequence Analysis-All Coding Exons) (Postnatal)	LIPH	LIPH, LAH2, ARWH2, HYPT7	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Woolly hair autosomal recessive 2 (ARWH2) [MIM:604379]: A hair shaft disorder characterized by fine and tightly curled hair. Compared to normal curly hair that is observed in some populations, woolly hair grows slowly and stops growing after a few inches. Under light microscopy, woolly hair shows some structural anomalies, including trichorrhexis nodosa and tapered ends. Some individuals may present with hypotrichosis. {ECO:0000269	PubMed:18830268}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Hipotrikozis 8, 278150, Otozomal Resesif; HYPT8 (Yünsü Saçlar) (LPAR6 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis 8, 278150, Autosomal recessive; HYPT8 (Woolly hair) (LPAR6 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	LPAR6	LPAR6, P2RY5, P2Y5, LAH3, ARWH1, HYPT8	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Woolly hair autosomal recessive 1 with or without hypotrichosis (ARWH1) [MIM:278150]: A hair shaft disorder characterized by fine and tightly curled hair. Compared to normal curly hair that is observed in some populations, woolly hair grows slowly and stops growing after a few inches. Under light microscopy, woolly hair shows some structural anomalies, including trichorrhexis nodosa and tapered ends. Some individuals exhibit features of hypotrichosis. {ECO:0000269	PubMed:18297072}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Hipotrikozis ve Rekürren Deri Veziküller, 613102, Otozomal Resesif (Kalıtsal Hipotrikoz-Tekrarlayan Cilt Veziküller) (DSC3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis and recurrent skin vesicles, 613102, Autosomal recessive (Hereditary hypotrichosis with recurrent skin vesicles) (DSC3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	DSC3	DSC3, DSC4	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypotrichosis and recurrent skin vesicles (HRSV) [MIM:613102]: A disorder characterized by hypotrichosis and the appearance of recurrent skin vesicle formation. Affected individuals show sparse and fragile hair on scalp, as well as absent eyebrows and eyelashes. Vesicles filled with thin, watery fluid are observed on the scalp and skin of most of the body. Mucosal vesicles are absent. {ECO:0000269	PubMed:19765682}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Hipotrikozis-Lenfödem-Telenjiektazi Sendromu, 607823, Otozomal Resesif; HLTS (Hipotrikoz-Lenfödem-Telenjiektazi-Renal Defekt Sendromu) (SOX18 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypotrichosis-lymphedema-telangiectasia syndrome, 607823, Autosomal recessive; HLTS (Hypotrichosis-lymphedema-telangiectasia-renal defect syndrome) (SOX18 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	SOX18	SOX18, HLTS, HLTRS	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypotrichosis-lymphedema-telangiectasia-renal defect syndrome (HLTRS) [MIM:137940]: A syndrome characterized by sparse hair, lymphatic edemas, peripheral vein anomalies, and renal disease. {ECO:0000269|PubMed:12740761, ECO:0000269|PubMed:24697860}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample

Siemens Tipi İktiyozis Büllöza, 146800, Otozomal Dominant (Yüzeyel Epidermolitik İktiyoz) (KRT2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Ichthyosis bullosa of Siemens, 146800, Autosomal dominant (Superficial epidermolytic ichthyosis) (KRT2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	KRT2	KRT2, KRT2A, KRT2E	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Ichthyosis bullosa of Siemens (IBS) [MIM:146800]: A rare autosomal dominant skin disorder displaying a type of epidermolytic hyperkeratosis characterized by generalized erythema and extensive blistering from birth. Large, dark gray hyperkeratoses are observed in later weeks. The skin of IBS patients is unusually fragile and has a tendency to shed the outer layers of the epidermis, producing localized denuded areas (molting effect). IBS usually improves with age so that in most middle-aged patients the hyperkeratosis and keratotic lichenification is limited to the flexural folds of the major joints. {ECO:0000269|PubMed:10084318, ECO:0000269|PubMed:10233323, ECO:0000269|PubMed:10564334, ECO:0000269|PubMed:10620137, ECO:0000269|PubMed:10688369, ECO:0000269|PubMed:11167982, ECO:0000269|PubMed:11531804, ECO:0000269|PubMed:15949009, ECO:0000269|PubMed:7521371, ECO:0000269|PubMed:7524919, ECO:0000269|PubMed:8077693, ECO:0000269|PubMed:9036938, ECO:0000269|PubMed:9204966, ECO:0000269|PubMed:9804344, ECO:0000269|PubMed:9833038}. İktiyozis, Konjenital, Otozomal Resesif 4B (Alacalı), 242500, Otozomal Resesif; ARCI4B (Harlequin İktiyoz) (Prenatal) (ABCA12 geni) (Tüm Gen Dizi Analizi) (Prenatal)	Ichthyosis, congenital, autosomal recessive 4B (harlequin), 242500, Autosomal recessive; ARCI4B (Harlequin ichthyosis) (ABCA12 gene) (Sequence Analysis-All Coding Exons) (Prenatal)	ABCA12	ABCA12, ARCI4A, ARCI4B, ICR2B, LI2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	Amniyon sıvısı / CVS / Heparinli ve EDTA'lı (İKİSİ BİRDEN) kordon kanı VE ANNEDEN EDTA'LI KAN		.	.	15	30	20	Prenatal	DISEASE: Ichthyosis, congenital, autosomal recessive 4B (ARCI4B) [MIM:242500]: A rare, very severe form of congenital ichthyosis, in which the neonate is born with a thick covering of armor-like scales. The skin dries out to form hard diamond-shaped plaques separated by fissures, resembling 'armor plating'. The normal facial features are severely affected, with distortion of the lips (ectropion), eyelids (ectropion), ears, and nostrils. Affected babies are often born prematurely and rarely survive the perinatal period. Babies who survive into infancy and beyond develop skin changes resembling severe non-bullous congenital ichthyosiform erythroderma. (ECO:0000269|PubMed:15756637, ECO:0000269|PubMed:16675967, ECO:0000269|PubMed:16902423). Note=The disease is caused by mutations affecting the gene represented in this entry. Haploinsufficiency of SLC6A20 combined with deficiency of the neutral amino acid transporter SLC6A19 or partially inactivating mutations in SLC36A2, is responsible for iminoglycinuria. Additional polymorphisms and mutations in SLC6A18 can contribute to the IG phenotype in some families.;	EDTA Blood Sample

İminoglisinüri, Dijenik, 242600, Otozomal Resesif, Dijenik Resesif (İminoglisinüri) (SLC6A19 geni) (Tüm Gen Dizi Analizi) (Postnatal)	İminoglycinuria, digenic, 242600, Autosomal recessive, Digenic recessive (Iminoglycinuria) (SLC6A19 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	SLC6A19	SLC6A19, HND	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hyperglycinuria (HG) [MIM:138500]: A condition characterized by excess of glycine in the urine. In some cases it is associated with renal colic and renal oxalate stones. {ECO:0000269	PubMed:19033659}. Note=The disease may be caused by mutations affecting the gene represented in this entry. SLC6A19 deficiency combined with haploinsufficiency of SLC6A20 or partially inactivating mutations in SLC36A2, can be responsible for hyperglycinuria.	EDTA Blood Sample
İminoglisinüri, Dijenik, 242600, Otozomal Resesif, Dijenik Resesif (İminoglisinüri) (SLC36A2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	İminoglycinuria, digenic, 242600, Autosomal recessive, Digenic recessive (Iminoglycinuria) (SLC36A2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	SLC36A2	SLC36A2, PAT2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Iminoglycinuria (IG) [MIM:242600]: A disorder of renal tubular reabsorption of glycine and imino acids (proline and hydroxyproline), marked by excessive levels of all three substances in the urine. {ECO:0000269	PubMed:19033659}. Note=The disease is caused by mutations affecting distinct genetic loci, including the gene represented in this entry. Mutations in SLC36A2 that retain residual transport activity result in the IG phenotype only when combined with haploinsufficiency of the imino acid transporter SLC6A20 or deficiency of the neutral amino acid transporter SLC6A19. Additional polymorphisms and mutations in SLC6A18 can contribute to iminoglycinuria in some families.	EDTA Blood Sample

Other microorganisms rarely cause severe clinical disease in individuals with susceptibility to mycobacterial infections, with the exception of Salmonella which infects less than 50% of these individuals. Clinical outcome severity depends on the degree of impairment of interferon-gamma mediated immunity. Some patients die of overwhelming mycobacterial disease with lepromatous-like lesions in early childhood, whereas others develop, later in life, disseminated but curable infections with tuberculoid granulomas. {ECO:0000269|PubMed:10811850, ECO:0000269|PubMed:9389728}. Note=The disease is caused by mutations affecting the gene represented in this entry.	Amniotic Fluid / CVS / Heparinized and EDTA (BOTH) Fetal Blood and Maternal EDTA Blood Sample
İmmün Yetmezlik 28, Mikobakteriyoz, 614889, Otozomal Resesif; IMD28 (Mikobakteriyel Hastalıklara Mendelyen Yatkınlık, Komplet İfngamar2 Eksikliğine Bağlı) (IFNGR2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Immunodeficiency 28, mycobacteriosis, 614889, Autosomal recessive; IMD28 (Mendelian susceptibility to mycobacterial diseases due to complete IFNgammaR2 deficiency) (IFNGR2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	IFNGR2	IFNGR2, IFNGT1, IFGR2, IMD28	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	60	Postnatal	DISEASE: Immunodeficiency 28 (IMD28) [MIM:614889]: A form of Mendelian susceptibility to mycobacterial disease, a rare condition caused by impairment of interferon-gamma mediated immunity. It is characterized by predisposition to illness caused by moderately virulent mycobacterial species, such as Bacillus Calmette-Guerin (BCG) vaccine, environmental non-tuberculous mycobacteria, and by the more virulent Mycobacterium tuberculosis. Other microorganisms rarely cause severe clinical disease in individuals with susceptibility to mycobacterial infections, with the exception of Salmonella which infects less than 50% of these individuals. Clinical outcome severity depends on the degree of impairment of interferon-gamma mediated immunity. Some patients die of overwhelming mycobacterial disease with lepromatous-like lesions in early childhood, whereas others develop, later in life, disseminated but curable infections with tuberculoid granulomas. IMD28 manifests early in life, with severe, often fatal, infection. {ECO:0000269	PubMed:15924140}. İmmün Yetmezlik, Yaygın Değişken, 2, 240500, Otozomal Resesif, Otozomal Dominant; CVID2 (İmmun Yetmezlik, Yaygın Değişken) (TNFRSF13B geni) (Tüm Gen Dizi Analizi) (Postnatal)	Immunodeficiency, common variable, 2, 240500, Autosomal recessive, Autosomal dominant; CVID2 (Common variable immunodeficiency) (TNFRSF13B gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TNFRSF13B	TNFRSF13B, TACI, CVID2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Immunoglobulin A deficiency 2 (IGAD2) [MIM:609529]: Selective deficiency of immunoglobulin A (IGAD) is the most common form of primary immunodeficiency, with an incidence of approximately 1 in 600 individuals in the western world. Individuals with symptomatic IGAD often have deficiency of IgG subclasses or decreased antibody response to carbohydrate antigens such as pneumococcal polysaccharide vaccine. Individuals with IGAD also suffer from recurrent sinopulmonary and gastrointestinal infections and have an increased incidence of autoimmune disorders and of lymphoid and non-lymphoid malignancies. In vitro studies have suggested that some individuals with IGAD have impaired isotype class switching to IgA and others may have a post-switch defect. IGAD and CVID have been known to coexist in families. Some individuals initially present with IGAD1 and then develop CVID. These observations suggest that some cases of IGAD and CVID may have a common etiology. {ECO:0000269	PubMed:16007086}. İmmünoglobulin A Eksikliği 2, 609529; IGAD2 (TNFRSF13B gen) (Tüm Gen Dizi Analizi) (Postnatal)	Immunoglobulin A deficiency 2, 609529; IGAD2 (TNFRSF13B gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TNFRSF13B	TNFRSF13B, TACI, CVID2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Immunoglobulin A deficiency 2 (IGAD2) [MIM:609529]: Selective deficiency of immunoglobulin A (IGAD) is the most common form of primary immunodeficiency, with an incidence of approximately 1 in 600 individuals in the western world. Individuals with symptomatic IGAD often have deficiency of IgG subclasses or decreased antibody response to carbohydrate antigens such as pneumococcal polysaccharide vaccine. Individuals with IGAD also suffer from recurrent sinopulmonary and gastrointestinal infections and have an increased incidence of autoimmune disorders and of lymphoid and non-lymphoid malignancies. In vitro studies have suggested that some individuals with IGAD have impaired isotype class switching to IgA and others may have a post-switch defect. IGAD and CVID have been known to coexist in families. Some individuals initially present with IGAD1 and then develop CVID. These observations suggest that some cases of IGAD and CVID may have a common etiology. {ECO:0000269	PubMed:16007086}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample

Intervertebral Disk Hastalığı, Yatkınlık, 603932; IDD (COL9A3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Intervertebral disc disease, susceptibility to, 603932; IDD (COL9A3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	COL9A3	COL9A3, EDM3, IDD	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Multiple epiphyseal dysplasia 3 (EDM3) [MIM:600969]: A generalized skeletal dysplasia associated with significant morbidity. Joint pain, joint deformity, waddling gait, and short stature are the main clinical signs and symptoms. Radiological examination of the skeleton shows delayed, irregular mineralization of the epiphyseal ossification centers and of the centers of the carpal and tarsal bones. Multiple epiphyseal dysplasia is broadly categorized into the more severe Fairbank and the milder Ribbing types. The Fairbank type is characterized by shortness of stature, short and stubby fingers, small epiphyses in several joints, including the knee, ankle, hand, and hip. The Ribbing type is confined predominantly to the hip joints and is characterized by hands that are normal and stature that is normal or near-normal. {ECO:0000269	PubMed:10090888}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample

Joubert Sendromu 18, 614815, Otozomal Resesif, JBTS18 (Joubert Sendromu-Orofasiyodijital Defekt) (TCTN3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Joubert syndrome 18, 614815, Autosomal recessive; JBTS18 (Joubert syndrome with orofaciodigital defect) (TCTN3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TCTN3	TCTN3, TECT3, C10orf61, OFD4, JBTS18	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Orofaciodigital syndrome 4 (OFD4) [MIM:258860]: A form of orofaciodigital syndrome, a group of heterogeneous disorders characterized by malformations of the oral cavity, face and digits, and associated phenotypic abnormalities that lead to the delineation of various subtypes. OFD4 patients have tongue nodules, multiple frenulae, broad flat nose, hypertelorism, and short rib polydactyly with tibial dysplasia (Majewski syndrome). The presence of severe tibial aplasia differentiates OFD4 from OFD1. Additional features of cystic dysplastic kidneys and brain malformation, including occipital encephalocele, are observed in severely affected patients. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample

Four clinical forms are recognized. The infantile form accounts for 90% of cases. It manifests before six months of age with irritability, spasticity, arrest of motor and mental development, and bouts of temperature elevation without infection. This is followed by myoclonic jerks of arms and legs, oposthotonus, hypertonic fits, and mental regression, which progresses to a severe decerebrate condition with no voluntary movements and death from respiratory infections or cerebral hyperpyrexia before 2 years of age. Cases with later onset present with unexplained blindness, weakness and sensorimotor peripheral neuropathy, mental deterioration and death. {ECO:0000269|PubMed:10234611, ECO:0000269|PubMed:10477434, ECO:0000269|PubMed:17579360, ECO:0000269|PubMed:20886637, ECO:0000269|PubMed:23462331, ECO:0000269|PubMed:8595408, ECO:0000269|PubMed:8786069, ECO:0000269|PubMed:8940268, ECO:0000269|PubMed:9272171}. Laktaz Eksikliği, Konjenital, 223000, Otozomal Resesif (Konjenital Laktaz Eksikliği) (LCT geni) (Tüm Gen Dizi Analizi) (Postnatal)	Lactase deficiency, congenital, 223000, Autosomal recessive (Congenital lactase deficiency) (LCT gene) (Sequence Analysis-All Coding Exons) (Postnatal)	LCT	LCT, LAC, LPH	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Congenital lactase deficiency (COLACD) [MIM:223000]: Autosomal recessive, rare and severe gastrointestinal disorder. It is characterized by watery diarrhea in infants fed with breast milk or other lactose-containing formulas. An almost total lack of LCT activity is found in jejunal biopsy material of patients with congenital lactase deficiency. Opposite to congenital lactase deficiency, also known as lactose intolerance, is the most common enzyme deficiency worldwide. It is caused by developmental down- regulation of lactase activity during childhood or early adulthood. The decline of lactase activity is a normal physiological phenomenon; however, the majority of Northern Europeans have the ability to maintain lactase activity and digest lactose throughout life (lactase persistence). The down-regulation of lactase activity operates at the transcriptional level and it is associated with a noncoding variation in the MCM6 gene, located in the upstream vicinity of LCT. (ECO:0000269	PubMed:16400612). Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample

Legg-Calve-Perthes Hastalığı, 150600, Otozomal Dominant; LCPD (Legg-Calvé-Perthes Hastalığı) (COL2A1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Legg-Calve-Perthes disease, 150600, Autosomal dominant; LCPD (Legg-Calvé-Perthes disease) (COL2A1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	COL2A1	COL2A1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Stickler syndrome 1 (STL1) [MIM:108300]: An autosomal dominant form of Stickler syndrome, an inherited disorder that associates ocular signs with more or less complete forms of Pierre Robin sequence, bone disorders and sensorineural deafness. Ocular disorders may include juvenile cataract, myopia, strabismus, vitreoretinal or chorioretinal degeneration, retinal detachment, and chroric uveitis. Pierre Robin sequence includes an opening in the roof of the mouth (a cleft palate), a large tongue (macroglossia), and a small lower jaw (micrognathia). Bones are affected by slight platyspondylisis and large, often defective epiphyses. Juvenile joint laxity is followed by early signs of arthrosis. The degree of hearing loss varies among affected individuals and may become more severe over time. Syndrome expressivity is variable. {ECO:0000269|PubMed:11007540, ECO:0000269|PubMed:20513134, ECO:0000269|PubMed:7977371}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Legg-Calve-Perthes Hastalığı, 150600, Otozomal Dominant; LCPD (Legg-Calvé-Perthes Hastalığı) (MLPA)	Legg-Calve-Perthes disease, 150600, Autosomal dominant; LCPD (Legg-Calvé-Perthes disease) (MLPA)	COL2A1	COL2A1	MLPA (CNV)	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	DISEASE: Stickler syndrome 1 (STL1) [MIM:108300]: An autosomal dominant form of Stickler syndrome, an inherited disorder that associates ocular signs with more or less complete forms of Pierre Robin sequence, bone disorders and sensorineural deafness. Letal Konjenital Kontraktür Sendromu 2, 607598, Otozomal Resesif; LCCS2 (Letal Konjenital Kontraktür Sendromu Tip 2) (ERBB3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Lethal congenital contractural syndrome 2, 607598, Autosomal recessive; LCCS2 (Lethal congenital contracture syndrome type 2) (ERBB3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ERBB3	ERBB3, LCCS2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Lethal congenital contracture syndrome 2 (LCCS2) [MIM:607598]: A form of lethal congenital contracture syndrome, an autosomal recessive disorder characterized by degeneration of anterior horn neurons, extreme skeletal muscle atrophy, and congenital non-progressive joint contractures (arthrogryposis). The contractures can involve the upper or lower limbs and/or the vertebral column, leading to various degrees of flexion or extension limitations evident at birth. LCCS2 patients manifest craniofacial/ocular findings, lack of hydrops, multiple pterygia, and fractures, as well as a normal duration of pregnancy and a unique feature of a markedly distended urinary bladder (neurogenic bladder defect). The phenotype suggests a spinal cord neuropathic etiology. {ECO:0000269	PubMed:17701904}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample

AML is a malignant disease of bone marrow characterized by maturational arrest of hematopoietic precursors at an early stage of development. Clonal expansion of myeloid blasts occurs in bone marrow, blood, and other tissue. Myelogenous leukemias develop from changes in cells that normally produce neutrophils, basophils, eosinophils and monocytes. {ECO:0000269|PubMed:11090077, ECO:0000269|PubMed:11293608, ECO:0000269|PubMed:11442493, ECO:0000269|PubMed:14504097, ECO:0000269|PubMed:16266983, ECO:0000269|PubMed:18305215, ECO:0000269|PubMed:8946935, ECO:0000269|PubMed:9737679}. Note=The gene represented in this entry may be involved in disease pathogenesis. Somatic mutations that lead to constitutive activation of FLT3 are frequent in AML patients. These mutations fall into two classes, the most common being in-frame internal tandem duplications of variable length in the juxtamembrane region that disrupt the normal regulation of the kinase activity. Likewise, point mutations in the activation loop of the kinase domain can result in a constitutively activated kinase.;	EDTA blood sample / EDTA bone marrow

Lösemi, Akut Lenfoblastik, Yatkınlık, 3, 615545; ALL3 (Prekürsör B-Hücreli Akut Lenfoblastik Lösemi) (PAX5 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute lymphoblastic, susceptibility to, 3, 615545; ALL3 (Precursor B-cell acute lymphoblastic leukemia) (PAX5 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	PAX5	PAX5, BSAP, ALL3	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Leukemia, acute lymphoblastic, 3 (ALL3) [MIM:613065]: A subtype of acute leukemia, a cancer of the white blood cells. Acute lymphoblastic anemia is a malignant disease of bone marrow and the most common malignancy diagnosed in children. The malignant cells are lymphoid precursor cells (lymphoblasts) that are arrested in an early stage of development. The lymphoblasts replace the normal marrow elements, resulting in a marked decrease in the production of normal blood cells. Consequently, anemia, thrombocytopenia, and neutropenia occur to varying degrees. The lymphoblasts also proliferate in organs other than the marrow, particularly the liver, spleen, and lymphnodes. (ECO:0000269	PubMed:24013638). Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.;	EDTA Blood Sample
Lösemi, Akut Myeloid (NPM1 geni) (Tüm Gen - Dizi Analizi) (NPM1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute myeloid (NPM1 gen) (All coding exons - Sequence analysis) (NPM1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NPM1	.	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=A chromosomal aberration involving NPM1 is found in a form of non-Hodgkin lymphoma. Translocation t(2;5)(p23;q35) with ALK. The resulting chimeric NPM1-ALK protein homodimerize and the kinase becomes constitutively activated. (ECO:0000269|PubMed:8122112, ECO:0000269|PubMed:8633027).	EDTA Blood Sample/ EDTA Bone Marrow
Lösemi, Akut Myeloid, 601626, Otozomal Dominant (Akut Miyeloid Lösemi) (TERT geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute myeloid, 601626, Autosomal dominant (Acute myeloid leukemia) (TERT gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TERT	TERT, TCS1, EST2, DKCA2, DKCB4, PFBMFT1, CMM9	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Pulmonary fibrosis, idiopathic (IPF) [MIM:178500]: A lung disease characterized by shortness of breath, radiographically evident diffuse pulmonary infiltrates, and varying degrees of inflammation and fibrosis on biopsy. In some cases, the disorder can be rapidly progressive and characterized by sequential acute lung injury with subsequent scarring and end-stage lung disease. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.	EDTA Blood Sample
Lösemi, Akut Miyeloid, 601626, Otozomal Dominant (Akut Miyeloid Lösemi) (SH3GL1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute myeloid, 601626, Autosomal dominant (Acute myeloid leukemia) (SH3GL1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	SH3GL1	SH3GL1, EEN	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=In some cases of acute leukemia, a translocation results in the formation of a KMT2A/MLL1-EEN fusion gene. (ECO:0000269	PubMed:9122235).;	EDTA Blood Sample
Lösemi, Akut Miyeloid, 601626, Otozomal Dominant (Akut Miyeloid Lösemi) (RUNX1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute myeloid, 601626, Autosomal dominant (Acute myeloid leukemia) (RUNX1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	RUNX1	RUNX1, CBFA2, AML1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Familial platelet disorder with associated myeloid malignancy (FPDMM) [MIM:601399]: Autosomal dominant disease characterized by qualitative and quantitative platelet defects, and propensity to develop acute myelogenous leukemia. (ECO:0000269	PubMed:10508512). Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Lösemi, Akut Miyeloid, 601626, Otozomal Dominant (Akut Miyeloid Lösemi) (NSD3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute myeloid, 601626, Autosomal dominant (Acute myeloid leukemia) (NSD3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NSD3	WHSC1L1, NSD3	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	. EDTA Blood Sample
Lösemi, Akut Promiyelositik, 612376; APL (Akut Promiyelositik Lösemi) (RARA geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute promyelocytic, 612376; APL (Acute promyelocytic leukemia) (RARA gene) (Sequence Analysis-All Coding Exons) (Postnatal)	RARA	RARA	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=Chromosomal aberrations involving RARA are commonly found in acute promyelocytic leukemia. Translocation t(11;17)(q32;q21) with ZBTB16/PLZF; translocation t(15;17)(q21;q21) with PML; translocation t(5;17)(q32;q11) with NPM. The PML-RARA oncoprotein requires both the PML ring structure and coiled-coil domain for both interaction with UBE2I, nuclear microspecle location and sumoylation. In addition, the coiled- coil domain functions in blocking RA-mediated transactivation and cell differentiation. {ECO:0000269|PubMed:12691149, ECO:0000269|PubMed:8302850, ECO:0000269|PubMed:8562653}.	EDTA Blood Sample
Lösemi, Akut Promiyelositik, PLZF / RARA Tipi (ZBTB16 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute promyelocytic, PLZF/RARA type (ZBTB16 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ZBTB16	ZBTB16, ZNF145, PLZF	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Skeletal defects, genital hypoplasia, and mental retardation (SGYMR) [MIM:612447]: A disorder characterized by mental retardation, craniofacial dysmorphism, microcephaly and short stature. Additional features include absence of the thumbs, hypoplasia of the radii and ulnae, additional vertebrae and ribs, retarded bone age and genital hypoplasia. {ECO:0000269	PubMed:18611983}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Lösemi, Akut Promiyelositik, PML / RARA Tipi (PML geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute promyelocytic, PML/RARA type (PML gene) (Sequence Analysis-All Coding Exons) (Postnatal)	PML	PML, MYL	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=A chromosomal aberration involving PML may be a cause of acute promyelocytic leukemia (APL). Translocation t(15;17)(q21;q21) with RARA. The PML breakpoints (type A and type B) lie on either side of an alternatively spliced exon. {ECO:0000269|PubMed:1652369, ECO:0000269|PubMed:17205701}.	EDTA Blood Sample
Lösemi, Akut Promiyelositik, Somatik, 102578 (STAT5B geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute promyelocytic, somatic, 102578 (STAT5B gene) (Sequence Analysis-All Coding Exons) (Postnatal)	STAT5B	STAT5B	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)/ EDTA'lı Kemik İliği (2-3 ml)		30	120	.	.	60	Postnatal	.	EDTA blood sample / EDTA bone marrow
Lösemi, Akut Promiyelositik, Somatik, 612376 (Akut Promiyelositik Lösemi) (NUMA1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute promyelocytic, somatic, 612376 (Acute promyelocytic leukemia) (NUMA1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NUMA1	NUMA1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)/ EDTA'lı Kemik İliği (2-3 ml)		30	120	.	.	60	Postnatal	.	EDTA blood sample / EDTA bone marrow
Lösemi, Akut T Hücresi, 180385 (LMO2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, acute T-cell, 180385 (LMO2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	LMO2	LMO2, RBTNL1, RHOM2, TTG2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=A chromosomal aberration involving LMO2 may be a cause of a form of T-cell acute lymphoblastic leukemia (T-ALL). Translocation t(11;14)(p13;q11) with TCRD.;	EDTA Blood Sample
Lösemi, Jüvenil Miyelomonositik, 607785, Otozomal Dominant, Somatik Mutasyon, JMML (Jüvenil Miyelomonositik Lösemi) (NF1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, juvenile myelomonocytic, 607785, Autosomal dominant, Somatic mutation; JMML (Juvenile myelomonocytic leukemia) (NF1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NF1	NF1, VRNF, WSS, NFNS	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)/ EDTA'lı Kemik İliği (2-3 ml)		30	120	.	.	60	Postnatal	.	EDTA blood sample / EDTA bone marrow
Lösemi, Jüvenil Miyelomonositik, 607785, Otozomal Dominant, Somatik Mutasyon; JMML (Jüvenil Miyelomonositik Lösemi) (MLPA)	Leukemia, juvenile myelomonocytic, 607785, Autosomal dominant, Somatic mutation; JMML (Juvenile myelomonocytic leukemia) (MLPA)	NF1	NF1, VRNF, WSS, NFNS	MLPA (CNV)	EDTA'lı Kan (2-4 ml)/ EDTA'lı Kemik İliği (2-3 ml)		20	60	.	.	30	Postnatal		EDTA blood sample / EDTA bone marrow
Lösemi, Jüvenil Miyelomonositik, Somatik, 607785 (Jüvenil Miyelomonositik Lösemi) (PTPN11 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, juvenile myelomonocytic, somatic, 607785 (Juvenile myelomonocytic leukemia) (PTPN11 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	PTPN11	PTPN11, PTP2C, SHP2, NS1, JMML, METCDS	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)/ EDTA'lı Kemik İliği (2-3 ml)		30	120	.	.	60	Postnatal	.	EDTA blood sample / EDTA bone marrow
Lösemi, Jüvenil Miyelomonositik, Somatik, 607785 (Jüvenil Miyelomonositik Lösemi) (ARHGAP26 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, juvenile myelomonocytic, somatic, 607785 (Juvenile myelomonocytic leukemia) (ARHGAP26 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ARHGAP26	ARHGAP26, GRAF	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)/ EDTA'lı Kemik İliği (2-3 ml)		30	120	.	.	60	Postnatal	DISEASE: Leukemia, juvenile myelomonocytic (JMML) [MIM:607785]: An aggressive pediatric myelodysplastic syndrome/myeloproliferative disorder characterized by malignant transformation in the hematopoietic stem cell compartment with proliferation of differentiated progeny. Patients have splenomegaly, enlarged lymph nodes, rashes, and hemorrhages. Note=The gene represented in this entry is involved in disease pathogenesis. A chromosomal translocation t(5:11)(q31;q23) with KMT2A/MLL1 has been found in leukemic cells from JMML patients, also carrying inactivating mutations on the second allele (PubMed:10908648). {ECO:0000269	PubMed:10908648}.;	EDTA blood sample / EDTA bone marrow
Lösemi, Megakaryoblastik, ± Down Sendromu, 190685 (Trombositopeni-Konjenital Diseritropoietik Anemi) (GATA1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, megakaryoblastic, with or without Down syndrome, somatic, 190685 (Thrombocytopenia with congenital dyserythropoietic anemia) (GATA1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	GATA1	GATA1, GF1, ERYF1, NFE1, XLTDA, XLTT, XLANP	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: X-linked dyserythropoietic anemia and thrombocytopenia (XDAT) [MIM:300367]: Disorder characterized by erythrocytes with abnormal size and shape, and paucity of platelets in peripheral blood. The bone marrow contains abundant and abnormally small megakaryocytes. {ECO:0000269|PubMed:10700180, ECO:0000269|PubMed:11418466, ECO:0000269|PubMed:11675338, ECO:0000269|PubMed:11809723}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Lösemi, Miyeloid / Lenfoid Veya Karışık-Hücre Dizisi, 159555, Otozomal Dominant (KMT2A geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, myeloid/lymphoid or mixed-lineage, 159555, Autosomal dominant (KMT2A gene) (Sequence Analysis-All Coding Exons) (Postnatal)	KMT2A	KMT2A, MLL, HRX, HTRX1, WDSTS	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Wiedemann-Steiner syndrome (WDSTS) [MIM:605130]: A syndrome characterized by hairy elbows (hypertrichosis cubiti), intellectual disability, a distinctive facial appearance, and short stature. Facial characteristics include long eyelashes, thick or arched eyebrows with a lateral flare, and downslanting and vertically narrow palpebral fissures. {ECO:0000269	PubMed:22795537}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Lösemi, Philadelphia Kromozom Pozitif, İmatinib Dirençli (ABL1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, Philadelphia chromosome-positive, resistant to imatinib (ABL1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ABL1	ABL1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Leukemia, chronic myeloid (CML) [MIM:608232]: A clonal myeloproliferative disorder of a pluripotent stem cell with a specific cytogenetic abnormality, the Philadelphia chromosome (Ph), involving myeloid, erythroid, megakaryocytic, B-lymphoid, and sometimes T-lymphoid cells, but not marrow fibroblasts. Note=The gene represented in this entry is involved in disease pathogenesis.	EDTA Blood Sample
Lösemi, Kemoterapi Sonrası, Yatkinlik (NQO1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, post-chemotherapy, susceptibility to (NQO1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NQO1	NQO1, DIA4, NMOR1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
Lösemi, T Hücresi Akut Lenfoblastik, 186921 (LMO1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, T-cell acute lymphoblastic, 186921 (LMO1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	LMO1	LMO1, RBTN1, RHOM1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
Lösemi, T Hücresi Akut Lenfoblastik, Somatik, 613065 (Akut Lenfoblastik Lösemi) (NUP214 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, T-cell acute lymphoblastic, somatic, 613065 (Acute lymphoblastic leukemia) (NUP214 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NUP214	NUP214, D9S46E, CAN, CAIN	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)/ EDTA'lı Kemik İliği (2-3 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=A chromosomal aberration involving NUP214 is found in a subset of acute myeloid leukemia (AML); also known as acute non-lymphocytic leukemia. Translocation t(6;9)(p23;q34) with DEK. It results in the formation of a DEK-CAN fusion gene. {ECO:0000269	PubMed:15491223}.	EDTA blood sample / EDTA bone marrow
Lösemi, T-Hücresi Akut Lenfoblastoid, 151440 (LYL1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, T-cell acute lymphoblastoid, 151440 (LYL1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	LYL1	LYL1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=A chromosomal aberration involving LYL1 may be a cause of a form of T-cell acute lymphoblastic leukemia (T-ALL). Translocation t(7;19)(q35;q13.3) with TCRB.;	EDTA Blood Sample
Lösemi, T-Hücreli Akut Lenfositik, Somatik, 613065 (Akut Lenfoblastik Lösemi) (TAL2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, T-cell acute lymphocytic, somatic, 613065 (Acute lymphoblastic leukemia) (TAL2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TAL2	TAL2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)/ EDTA'lı Kemik İliği (2-3 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=A chromosomal aberration involving TAL2 may be a cause of some T-cell acute lymphoblastic leukemia (T-ALL). Translocation t(7;9)(q34;q32) with TCRB. {ECO:0000269	PubMed:17630561}.	EDTA blood sample / EDTA bone marrow

Lösemi, T-Hücreli Akut Lenfositik, Somatik, 613065 (Akut Lenfoblastik Lösemi) (TAL1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia, T-cell acute lymphocytic, somatic, 613065 (Acute lymphoblastic leukemia) (TAL1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TAL1	TAL1, TCL5, SCL	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)/ EDTA'lı Kemik İliği (2-3 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=A chromosomal aberration involving TAL1 may be a cause of some T-cell acute lymphoblastic leukemias (T-ALL). Translocation t(1;14)(p32;q11) with T-cell receptor alpha chain (TCRA) genes. (ECO:0000269	PubMed:2303035).	EDTA blood sample / EDTA bone marrow
Lösemi / Lenfoma, B Hücreli, 2 (BCL2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia/lymphoma, B-cell, 2 (BCL2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	BCL2	BCL2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=A chromosomal aberration involving BCL2 has been found in chronic lymphatic leukemia. Translocation t(14;18)(q32;q21) with immunoglobulin gene regions. BCL2 mutations found in non-Hodgkin lymphomas carrying the chromosomal translocation could be attributed to the Ig somatic hypermutation mechanism resulting in nucleotide transitions. (ECO:0000269	PubMed:2875799, ECO:0000269	PubMed:3365001)	EDTA Blood Sample
Lösemi / Lenfoma, B-Hücresi, 3, 109560 (BCL3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia/lymphoma, B-cell, 3, 109560 (BCL3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	BCL3	BCL3	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=A chromosomal aberration involving BCL3 may be a cause of B-cell chronic lymphocytic leukemia (B-CLL). Translocation t(14;19)(q32;q13.1) with immunoglobulin gene regions. (ECO:0000269	PubMed:2180580, ECO:0000269	PubMed:7896265).	EDTA Blood Sample
Lösemi / Lenfoma, T-Hücreli, 186960 (TCL1A geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia/lymphoma, T-cell, 186960 (TCL1A gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TCL1A	TCL1A, TCL1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal		EDTA Blood Sample
Lösemi / Lenfoma, T-Hücreli, 603769 (TCL1B geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukemia/lymphoma, T-cell, 603769 (TCL1B gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TCL1B	TCL1B, TML1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample

Leukoencephalopathy With Vanishing White Matter; VWM (Lökoensefalopati Kaybolan Beyaz Maddel, 603896, Otozomal Resesif (Geç İnfantil CACH Sendromu) (EIF2B4 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Leukoencephaly with vanishing white matter, 603896, Autosomal recessive; VWM (Late infantile CACH syndrome) (EIF2B4 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	EIF2B4	EIF2B4	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Leukodystrophy with vanishing white matter (VWM) [MIM:603896]: A leukodystrophy that occurs mainly in children. Neurological signs include progressive cerebellar ataxia, spasticity, inconstant optic atrophy and relatively preserved mental abilities. The disease is chronic-progressive with, in most individuals, additional episodes of rapid deterioration following febrile infections or minor head trauma. While childhood onset is the most common form of the disorder, some severe forms are apparent at birth. A severe, early-onset form seen among the Cree and Chippewayan populations of Quebec and Manitoba is called Cree leukoencephalopathy. Milder forms may not become evident until adolescence or adulthood. Some females with milder forms of the disease who survive to adolescence exhibit ovarian dysfunction. This variant of the disorder is called ovarioleukodystrophy. {ECO:0000269|PubMed:11835386, ECO:0000269|PubMed:12707859, ECO:0000269|PubMed:15776425}. Additional features are characteristic postural abnormalities, dysautonomia, dystonic cramps, and dementia. The pathology of Parkinson disease involves the loss of dopaminergic neurons in the substantia nigra and the presence of Lewy bodies (intraneuronal accumulations of aggregated proteins), in surviving neurons in various areas of the brain. The disease is progressive and usually manifests after the age of 50 years, although early-onset cases (before 50 years) are known. The majority of the cases are sporadic suggesting a multifactorial etiology based on environmental and genetic factors. However, some patients present with a positive family history for the disease. Familial forms of the disease usually begin at earlier ages and are associated with atypical clinical features. {ECO:0000269|PubMed:12847165, ECO:0000269|PubMed:16148263, ECO:0000269|PubMed:19286695}. Lipoma (LPP geni) (Tüm Gen Dizi Analizi) (Postnatal)	Lipoma (LPP gene) (Sequence Analysis-All Coding Exons) (Postnatal)	LPP	LPP	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=A chromosomal aberration involving LPP is associated with pulmonary chondroid hamartomas. Translocation t(3;12)(q27; q28;q14-q15) with HMGA2 is detected in pulmonary chondroid hamartomas.	EDTA Blood Sample
Lipom, Somatik (Multipl Endokrin Neoplazi Tip 1) (MEN1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Lipoma, somatic (Multiple endocrine neoplasia type 1) (MEN1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	MEN1	MEN1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	Etiklenmiş bölgeden alınan biyopsi-Transport besi yeri içinde		30	120	.	.	60	Postnatal	.	Biopsy of affected site-transport media

Lipoprotein Glomerülopati, 611771; LPG (Lipoprotein Glomerulopatisi) (APOE geni) (Tüm Gen Dizi Analizi) (Postnatal)	Lipoprotein glomerulopathy, 611771; LPG (Lipoprotein glomerulopathy) (APOE gene) (Sequence Analysis-All Coding Exons) (Postnatal)	APOE	APOE, AD2, LPG, LDLCQ5	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Alzheimer disease 2 (AD2) [MIM:104310]: A late-onset neurodegenerative disorder characterized by progressive dementia, loss of cognitive abilities, and deposition of fibrillar amyloid proteins as intraneuronal neurofibrillary tangles, extracellular amyloid plaques and vascular amyloid deposits. The major constituent of these plaques is the neurotoxic amyloid-beta-APP 40-42 peptide (s), derived proteolytically from the transmembrane precursor protein APP by sequential secretase processing. The cytotoxic C-terminal fragments (CTFs) and the caspase-cleaved products such as C31 derived from APP, are also implicated in neuronal death. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry. The APOE*4 allele is genetically associated with the common late onset familial and sporadic forms of Alzheimer disease. Risk for AD increased from 20% to 90% and mean age at onset decreased from 84 to 68 years with increasing number of APOE*4 alleles in 42 families with late onset AD. Thus APOE*4 gene dose is a major risk factor for late onset AD and, in these families, homozygosity for APOE*4 was virtually sufficient to cause AD by age 80. The mechanism by which APOE*4 participates in pathogenesis is not known.	EDTA Blood Sample
Lipoprotein Lipaz Eksikliği, 238600, Otozomal Resesif (Ailesel Lipoprotein Lipaz Eksikliği) (LPL geni) (Tüm Gen Dizi Analizi) (Postnatal)	Lipoprotein lipase deficiency, 238600, Autosomal recessive (Familial lipoprotein lipase deficiency) (LPL gene) (Sequence Analysis-All Coding Exons) (Postnatal)	LPL	LPL, LIPD, HDLCQ11	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Lipoprotein lipase deficiency (LPL deficiency) [MIM:238600]: Recessive disorder usually manifesting in childhood. On a normal diet, patients often present with abdominal pain, hepatosplenomegaly, lipemia retinalis, eruptive xanthomata, and massive hypertriglyceridemia, sometimes complicated with acute pancreatitis. {ECO:0000269|PubMed:10660334, ECO:0000269|PubMed:10787434, ECO:0000269|PubMed:11068186, ECO:0000269|PubMed:11099402, ECO:0000269|PubMed:11134145, ECO:0000269|PubMed:11441134, ECO:0000269|PubMed:12204001, ECO:0000269|PubMed:12641539, ECO:0000269|PubMed:12966036, ECO:0000269|PubMed:1400331, ECO:0000269|PubMed:1479292, ECO:0000269|PubMed:14984478, ECO:0000269|PubMed:15185149, ECO:0000269|PubMed:1521525, ECO:0000269|PubMed:15256764, ECO:0000269|PubMed:15877202, ECO:0000269|PubMed:1598907, ECO:0000269|PubMed:1619366, ECO:0000269|PubMed:1639392, ECO:0000269|PubMed:1674945, ECO:0000269|PubMed:1702428, ECO:0000269|PubMed:1730727, ECO:0000269|PubMed:1752947, ECO:0000269|PubMed:1907278, ECO:0000269|PubMed:1969408, ECO:0000269|PubMed:1975097	EDTA Blood Sample

Uzun QT Sendromu 4, 600919, Otozomal Dominant (Ailesel Uzun QT Sendromu) (ANK2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Long QT syndrome 4, 600919, Autosomal dominant (Familial long QT syndrome) (ANK2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ANK2	ANK2, LQT4	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Long QT syndrome 4 (LQT4) [MIM:600919]: A heart disorder characterized by a prolonged QT interval on the ECG and polymorphic ventricular arrhythmias. They cause syncope and sudden death in response to exercise or emotional stress, and can present with a sentinel event of sudden cardiac death in infancy. Long QT syndrome type 4 shows many atypical features compared to classical long QT syndromes, including pronounced sinus bradycardia, polyphasic T waves and atrial fibrillation. Cardiac repolarization defects may be not as severe as in classical LQT syndromes and prolonged QT interval on EKG is not a consistent feature. (ECO:0000269|PubMed:12571597, ECO:0000269|PubMed:15178757). Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Uzun QT Sendromu 5, 613695, Otozomal Dominant; LQT5 (Ailesel Uzun QT Sendromu) (KCNE1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Long QT syndrome 5, 613695, Autosomal dominant; LQT5 (Familial long QT syndrome) (KCNE1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	KCNE1	KCNE1, JLNS, LQT5, JLNS2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Jervell and Lange-Nielsen syndrome 2 (JLNS2) [MIM:612347]: An autosomal recessive disorder characterized by congenital deafness, prolongation of the QT interval, syncopal attacks due to ventricular arrhythmias, and a high risk of sudden death. (ECO:0000269|PubMed:10400998, ECO:0000269|PubMed:9328483, ECO:0000269|PubMed:9354783). Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Uzun QT Sendromu 6, 613693, Otozomal Dominant; LQT6 (Ailesel Uzun QT Sendromu) (KCNE2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Long QT syndrome 6, 613693, Autosomal dominant; LQT6 (Familial long QT syndrome) (KCNE2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	KCNE2	KCNE2, MIRP1, LQT6, ATFB4	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Atrial fibrillation, familial, 4 (ATFB4) [MIM:611493]: A familial form of atrial fibrillation, a common sustained cardiac rhythm disturbance. Atrial fibrillation is characterized by disorganized atrial electrical activity and ineffective atrial contraction promoting blood stasis in the atria and reduces ventricular filling. It can result in palpitations, syncope, thromboembolic stroke, and congestive heart failure. (ECO:0000269	PubMed:15368194). Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Long QT Sendromu 9, 611818; LQT9 (Ailesel Uzun QT Sendromu) (CAV3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Long QT syndrome 9, 611818; LQT9 (Familial long QT syndrome) (CAV3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CAV3	CAV3, LGMD1C, LQT9	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: HyperCKmia (HYPCK) [MIM:123320]: Characterized by persistent elevated levels of serum creatine kinase without muscle weakness. (ECO:0000269|PubMed:10746614, ECO:0000269|PubMed:12082049, ECO:0000269|PubMed:14663034, ECO:0000269|PubMed:15099591, ECO:0000269|PubMed:15580566). Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Long QT Sendromu 9, 611818; LQT9 (Ailesel Uzun QT Sendromu) (MLPA)	Long QT syndrome 9, 611818; LQT9 (Familial long QT syndrome) (MLPA)	CAV3	CAV3, LGMD1C, LQT9	MLPA (CNV)	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	DISEASE: HyperCKmia (HYPCK) [MIM:123320]: Characterized by persistent elevated levels of serum creatine kinase without muscle weakness. (ECO:0000269|PubMed:10746614, ECO:0000269|PubMed:12082049, ECO:0000269|PubMed:14663034, ECO:0000269|PubMed:15099591, ECO:0000269|PubMed:15580566). Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Uzun QT Sendromu-10, 611819, Otozomal Dominant; LQT10 (Ailesel Uzun QT Sendromu) (SCN4B geni) (Tüm Gen Dizi Analizi) (Postnatal)	Long QT syndrome-10, 611819, Autosomal dominant; LQT10 (Familial long QT syndrome) (SCN4B gene) (Sequence Analysis-All Coding Exons) (Postnatal)	SCN4B	SCN4B, LQT10, ATFB17	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Long QT syndrome 10 (LQT10) [MIM:611819]: A heart disorder characterized by a prolonged QT interval on the ECG and polymorphic ventricular arrhythmias. They cause syncope and sudden death in response to exercise or emotional stress, and can present with a sentinel event of sudden cardiac death in infancy. (ECO:0000269	PubMed:17592081). Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Uzun QT Sendromu-11, 611820; LQT11 (Ailesel Uzun QT Sendromu) (AKAP9 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Long QT syndrome-11, 611820; LQT11 (Familial long QT syndrome) (AKAP9 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	AKAP9	AKAP9, YOTIAO, AKAP450	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Long QT syndrome 11 (LQT11) [MIM:611820]: A heart disorder characterized by a prolonged QT interval on the ECG and polymorphic ventricular arrhythmias. They cause syncope and sudden death in response to exercise or emotional stress, and can present with a sentinel event of sudden cardiac death in infancy. (ECO:0000269	PubMed:18093912). Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Uzun QT Sendromu-3, 603830, Otozomal Dominant; LQT3; PFHB1A (Ailesel Uzun QT Sendromu) (SCN5A geni) (Tüm Gen Dizi Analizi) (Postnatal)	Long QT syndrome-3, 603830, Autosomal dominant; LQT3; PFHB1A (Familial long QT syndrome) (SCN5A gene) (Sequence Analysis-All Coding Exons) (Postnatal)	SCN5A	SCN5A, LQT3, VF1, HB1, SSS1, CMD1E, CDCD2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Atrial standstill 1 (ATRST1) [MIM:108770]: A rare arrhythmia characterized by the absence of electrical and mechanical activity in the atria. Electrocardiographically, it is characterized by bradycardia, the absence of P waves, and a junctional narrow complex escape rhythm. (ECO:0000269	PubMed:12522116). Note=The disease may be caused by mutations affecting distinct genetic loci, including the gene represented in this entry. A mutation in SCN5A has been detected in combination with a rare GJA5 genotype in a large family with atrial standstill.	EDTA Blood Sample
Uzun QT Sendromu, Kazanılmış, Azalmış Yatkınlık, 613688, Otozomal Dominant (Ailesel Uzun QT Sendromu) (ALG10 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Long QT syndrome, acquired, reduced susceptibility to, 613688, Autosomal dominant (Familial long QT syndrome) (ALG10 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ALG10	ALG10, KCR1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal		EDTA Blood Sample
Uzun Zincirli 3-Hidroksiaçil-CoA Dehidrojenaz Eksikliği (Uzun Zincirli 3-Hidroksiaçil-CoA Dehidrojenaz Eksikliği) (HADHA geni) (Tüm Gen Dizi Analizi) (Postnatal)	LONG-CHAIN 3-HYDROXYACYL-CoA DEHYDROGENASE DEFICIENCY (Long chain 3-hydroxyacyl-CoA dehydrogenase deficiency) (HADHA gene) (Sequence Analysis-All Coding Exons) (Postnatal)	HADHA	HADHA, MTPA	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Mitochondrial trifunctional protein deficiency (MTPD) [MIM:609015]: A disease biochemically characterized by loss of all enzyme activities of the mitochondrial trifunctional protein complex. Variable clinical manifestations include hypoglycemia, cardiomyopathy, delayed psychomotor development, sensorimotor axonopathy, generalized weakness, hepatic dysfunction, respiratory failure. Sudden infant death may occur. Most patients die from heart failure. (ECO:0000269	PubMed:9739053). Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Açil Koa Dehidrojenaz, Uzun Zincirli, Eksikliği, Otozomal Resesif (LCAD Eksikliği) (ACADL geni) (Tüm Gen Dizi Analizi) (Postnatal)	Long-chain acyl-CoA dehydrogenase deficiency, Autosomal Recessive (LCAD deficiency) (ACADL gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ACADL	ACADL, LCAD	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Acyl-CoA dehydrogenase very long-chain deficiency (ACADVLD) [MIM:201475]: An inborn error of mitochondrial fatty acid beta-oxidation which leads to impaired long-chain fatty acid beta-oxidation. It is clinically heterogeneous, with three major phenotypes: a severe childhood form characterized by early onset, high mortality and high incidence of cardiomyopathy; a milder childhood form with later onset, characterized by hypoketotic hypoglycemia, low mortality and rare cardiomyopathy; an adult form, with isolated skeletal muscle involvement, rhabdomyolysis and myoglobinuria, usually triggered by exercise or fasting. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Açil Koa Dehidrojenaz, Uzun Zincirli, Eksikliği, Otozomal Resesif (LCAD Eksikliği) (Prenatal) (ACADL geni) (Tüm Gen Dizi Analizi) (Prenatal)	Long-chain acyl-CoA dehydrogenase deficiency, Autosomal Recessive (LCAD deficiency) (ACADL gene) (Sequence Analysis-All Coding Exons) (Prenatal)	ACADL	ACADL, LCAD	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	Amniyon sıvısı / CVS / Heparinli ve EDTA'lı (İKİSİ BİRDEN) kordon kanı VE ANNEDEN EDTA'LI KAN		.	15	30	20	Prenatal	DISEASE: Acyl-CoA dehydrogenase very long-chain deficiency (ACADVLD) [MIM:201475]: An inborn error of mitochondrial fatty acid beta-oxidation which leads to impaired long-chain fatty acid beta-oxidation. Düşük Yoğunluklu Lipoprotein Kolesterol Seviyesi QTL 1, 603776 (PCSK9 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Low density lipoprotein cholesterol level QTL 1, 603776 (PCSK9 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	PCSK9	PCSK9, NARC1, HCHOLA3, FH3, LDLCQ1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypercholesterolemia, autosomal dominant, 3 (HCHOLA3) [MIM:603776]: A familial condition characterized by elevated circulating cholesterol contained in either low-density lipoproteins alone or also in very-low-density lipoproteins. (ECO:0000269|PubMed:12730697, ECO:0000269|PubMed:18799458, ECO:0000269|PubMed:24808179). Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Düşük Renin Hipertansiyon, Yatkınlık (CYP11B2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Low renin hypertension, susceptibility to (CYP11B2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CYP11B2	CYP11B2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Familial hyperaldosteronism 1 (FH1) [MIM:103900]: A disorder characterized by hypertension, variable hyperaldosteronism, and abnormal adrenal steroid production, including 18-oxocortisol and 18-hydroxycortisol. There is significant phenotypic heterogeneity, and some individuals never develop hypertension. Note=The disease is caused by mutations affecting the gene represented in this entry. The molecular defect causing hyperaldosteronism familial 1 is an anti-Lepore-type fusion of the CYP11B1 and CYP11B2 genes. The hybrid gene has the promoting part of CYP11B1, ACTH-sensitive, and the coding part of CYP11B2.;	EDTA Blood Sample

Lowe Sendromu, 309000, X'e Bağlı Resesif; OCRL (Lowe Okuloserebrorenal Sendromu) (OCRL geni) (Tüm Gen Dizi Analizi) (Postnatal)	Lowe syndrome, 309000, X-linked recessive; OCRL (Oculocerebrorenal syndrome of Lowe) (OCRL gene) (Sequence Analysis-All Coding Exons) (Postnatal)	OCRL	OCRL, LOCR, OCRL1, NPHL2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Dent disease 2 (DD2) [MIM:300555]: A renal disease belonging to the 'Dent disease complex', a group of disorders characterized by proximal renal tubular defect, hypercalciuria, nephrocalcinosis, and renal insufficiency. The spectrum of phenotypic features is remarkably similar in the various disorders, except for differences in the severity of bone deformities and renal impairment. Characteristic abnormalities include low-molecular-weight proteinuria and other features of Fanconi syndrome, such as glycosuria, aminoaciduria, and phosphaturia, but typically do not include proximal renal tubular acidosis. Progressive renal failure is common, as are nephrocalcinosis and kidney stones. {ECO:0000269|PubMed:15627218, ECO:0000269|PubMed:17384968, ECO:0000269|PubMed:21031565}. EDTA Blood Sample
Akciğer Kanseri, Direnç, 211980, Otozomal Resesif (MLPA)	Lung cancer, resistance to, 211980, Autosomal recessive (MLPA)	CYP2A6	CYP2A6, CYP2A3, CYP2A, P450C2A	MLPA (CNV)	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	.	EDTA Blood Sample
Akciğer Kanseri, Somatik, 211980 (SLC22A18 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Lung cancer, somatic, 211980 (SLC22A18 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	SLC22A18	SLC22A1L, BWSCR1A, IMPT1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	Tümör dokusu (Taze ve ya etanol ile fikse) / Parafinize doku bloğu		30	120	.	.	60	Postnatal	DISEASE: Rhabdomyosarcoma, embryonal, 1 (RMSE1) [MIM:268210]: A form of rhabdomyosarcoma, a highly malignant tumor of striated muscle derived from primitive mesenchymal cells and exhibiting differentiation along rhabdomyoblastic lines. Rhabdomyosarcoma is one of the most frequently occurring soft tissue sarcomas and the most common in children. It occurs in four forms: alveolar, pleomorphic, embryonal and botryoidal rhabdomyosarcomas. Note=The disease may be caused by mutations affecting the gene represented in this entry.;	Tumor tissue (Fresh or etanol fixed) /Parafinized tissue sample
Akciğer Kanseri, Somatik, 211980 (KRAS geni) (Tüm Gen Dizi Analizi) (Postnatal)	Lung cancer, somatic, 211980 (KRAS gene) (Sequence Analysis-All Coding Exons) (Postnatal)	KRAS	KRAS, KRAS2, RASK2, NS, CFC2, RALD	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	Tümör dokusu (Taze ve ya etanol ile fikse) / Parafinize doku bloğu		30	120	.	.	60	Postnatal	DISEASE: Leukemia, acute myelogenous (AML) [MIM:601626]: A subtype of acute leukemia, a cancer of the white blood cells. AML is a malignant disease of bone marrow characterized by maturational arrest of hematopoietic precursors at an early stage of development. Clonal expansion of myeloid blasts occurs in bone marrow, blood, and other tissue. Myelogenous leukemias develop from changes in cells that normally produce neutrophils, basophils, eosinophils and monocytes. {ECO:0000269|PubMed:8955068}. Note=The disease is caused by mutations affecting the gene represented in this entry.	Tumor tissue (Fresh or etanol fixed) /Parafinized tissue sample
Akciğer Kanseri, Somatik, 211980 (MAP3K8 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Lung cancer, somatic, 211980 (MAP3K8 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	MAP3K8	MAP3K8, COT, EST, TPL2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	Tümör dokusu (Taze ve ya etanol ile fikse) / Parafinize doku bloğu		30	120	.	.	60	Postnatal	.	Tumor tissue (Fresh or etanol fixed) /Parafinized tissue sample

Akciğer Kanseri, Yatkınlık, 211980, Otozomal Resesif (FASLG gen) (Tüm Gen Dizi Analizi) (Postnatal)	Lung cancer, susceptibility to, 211980, Autosomal recessive (FASLG gene) (Sequence Analysis-All Coding Exons) (Postnatal)	FASLG	FASLG, TNFSF6, APT1LG1, FASL, ALPS1B	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Autoimmune lymphoproliferative syndrome 1B (ALPS1B) [MIM:601859]: A disorder of apoptosis that manifests in early childhood and results in the accumulation of autoreactive lymphocytes. It is characterized by non-malignant lymphadenopathy with hepatosplenomegaly, and autoimmune hemolytic anemia, thrombocytopenia and neutropenia. {ECO:0000269	PubMed:8787672}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Akciğer Kanseri, Yatkınlık, 211980, Otozomal Resesif (ERCC6 gen) (Tüm Gen Dizi Analizi) (Postnatal)	Lung cancer, susceptibility to, 211980, Autosomal recessive (ERCC6 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ERCC6	ERCC6, CKN2, COFS1, CSB, ARMD5, UVSS1, POF11	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Cockayne syndrome B (CSB) [MIM:133540]: A rare disorder characterized by cutaneous sensitivity to sunlight, abnormal and slow growth, cachectic dwarfism, progeroid appearance, progressive pigmentary retinopathy and sensorineural deafness. There is delayed neural development and severe progressive neurologic degeneration resulting in mental retardation. Two clinical forms are recognized: in the classical form or Cockayne syndrome type 1, the symptoms are progressive and typically become apparent within the first few years of life; the less common Cockayne syndrome type 2 is characterized by more severe symptoms that manifest prenatally. Cockayne syndrome shows some overlap with certain forms of xeroderma pigmentosum. Unlike xeroderma pigmentosum, patients with Cockayne syndrome do not manifest increased freckling and other pigmentation abnormalities in the skin and have no significant increase in skin cancer. {ECO:0000269|PubMed:19894250, ECO:0000269|PubMed:9443879}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Akciğer Hastalıkları, İmmün Yetmezlik, ve Kromozom Kırılmasi Sendromu, 617241, Otozomal Resesif (NSMCE3 gen) (Tüm Gen Dizi Analizi) (Postnatal)	Lung disease, immunodeficiency, and chromosome breakage syndrome, 617241, Autosomal recessive (NSMCE3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NSMCE3	NSMCE3, NDNL2, MAGEG1, LICS	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	. DHS erythrocytes exhibit decreased total cation and potassium content that are not accompanied by a proportional net gain of sodium and water. DHS patients typically exhibit mild to moderate compensated hemolytic anemia, with an increased erythrocyte mean corpuscular hemoglobin concentration and a decreased osmotic fragility, both of which reflect cellular dehydration. Patients may also show perinatal edema and pseudohyperkalemia due to loss of potassium from red cells stored at room temperature. A minor proportion of red cells appear as stomatocytes on blood films. Complications such as splenomegaly and cholelithiasis, resulting from increased red cell trapping in the spleen and elevated bilirubin levels, respectively, may occur. The course of DHS is frequently associated with iron overload, which may lead to hepatosiderosis. {ECO:0000269|PubMed:22529292, ECO:0000269|PubMed:23479567, ECO:0000269|PubMed:23487776, ECO:0000269|PubMed:23581886, ECO:0000269|PubMed:23695678, ECO:0000269|PubMed:23973043}. Note=The disease is caused by mutations affecting the gene represented in this entry. All disease-causing mutations characterized so far produce a gain-of- function phenotype, mutated channels exhibiting increased cation transport in erythroid cells, that could be due to slower channel inactivation rate compared to the wild-type protein.;	EDTA Blood Sample

Lynch Sendromu 1 (Lynch Sendromu) (MSH2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	LYNCH SYNDROME I (Lynch syndrome) (MSH2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	MSH2	MSH2, COCA1, FCC1, HNPCC1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	DISEASE: Hereditary non-polyposis colorectal cancer 1 (HNPCC1) [MIM:120435]: An autosomal dominant disease associated with marked increase in cancer susceptibility. It is characterized by a familial predisposition to early-onset colorectal carcinoma (CRC) and extra-colonic tumors of the gastrointestinal, urological and female reproductive tracts. HNPCC is reported to be the most common form of inherited colorectal cancer in the Western world. Clinically, HNPCC is often divided into two subgroups. Type I is characterized by hereditary predisposition to colorectal cancer, a young age of onset, and carcinoma observed in the proximal colon. Type II is characterized by increased risk for cancers in certain tissues such as the uterus, ovary, breast, stomach, small intestine, skin, and larynx in addition to the colon. Diagnosis of classical HNPCC is based on the Amsterdam criteria: 3 or more relatives affected by colorectal cancer, one a first degree relative of the other two; 2 or more generation affected; 1 or more colorectal cancers presenting before 50 years of age; exclusion of hereditary polyposis syndromes. The term 'suspected HNPCC' or 'incomplete HNPCC' can be used to describe families who do not or only partially fulfill the Amsterdam criteria, but in whom a genetic basis for colon cancer is strongly suspected. {ECO:0000269|PubMed:10375096, ECO:0000269|PubMed:10386556, ECO:0000269|PubMed:10528862, ECO:0000269|PubMed:10573010, ECO:0000269|PubMed:10612836, ECO:0000269|PubMed:10777691, ECO:0000269|PubMed:10829038, ECO:0000269|PubMed:11726306, ECO:0000269|PubMed:11870161, ECO:0000269|PubMed:11926458	EDTA Blood Sample

EDTA Blood Sample
Makula Dejenerasyonu, Yaş İle İlişkili, 1, 603075, Otozomal Dominant; ARMD1 (HMCN1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 1, 603075, Autosomal dominant; ARMD1 (HMCN1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	HMCN1	HMCN1, FBLN6, FIBL6, ARMD1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
Makula Dejenerasyonu, Yaş İle İlişkili, 11, 611953; ARMD11 (Kalıtsal Serebral Hemoraji-Amiloidoz) (CST3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 11, 611953; ARMD11 (Hereditary cerebral hemorrhage with amyloidosis) (CST3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CST3	CST3, ARMD11	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Amyloidosis 6 (AMYL6) [MIM:105150]: A hereditary generalized amyloidosis due to cystatin C amyloid deposition. Cystatin C amyloid accumulates in the walls of arteries, arterioles, and sometimes capillaries and veins of the brain, and in various organs including lymphoid tissue, spleen, salivary glands, and seminal vesicles. Amyloid deposition in the cerebral vessels results in cerebral amyloid angiopathy, cerebral hemorrhage and premature stroke. Cystatin C levels in the cerebrospinal fluid are abnormally low. {ECO:0000269|PubMed:1352269, ECO:0000269|PubMed:2541223}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample

Maküla Dejenerasyonu, Yaş İle İlişkili, 12, 613784; ARMD12 (CX3CR1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 12, 613784; ARMD12 (CX3CR1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CX3CR1	CX3CR1, GPR13, V28	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Macular degeneration, age-related, 12 (ARMD12) [MIM:613784]: A form of age-related macular degeneration, a multifactorial eye disease and the most common cause of irreversible vision loss in the developed world. In most patients, the disease is manifest as ophthalmoscopically visible yellowish accumulations of protein and lipid that lie beneath the retinal pigment epithelium and within an elastin-containing structure known as Bruch membrane. {ECO:0000269	PubMed:15208270}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.;	EDTA Blood Sample
Maküla Dejenerasyonu, Yaş İle İlişkili 13, Yatkınlık, 615439, Otozomal Dominant; ARMD13 (İmmün Yetmezlik-Faktör 1 Anomasi) (CFI geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 13, susceptibility to, 615439, Autosomal dominant; ARMD13 (Immunodeficiency with factor I anomaly) (CFI gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CFI	CFI, FI, AHUS3, ARMD13	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Complement factor I deficiency (CFI deficiency) [MIM:610984]: Autosomal recessive condition associated with a propensity to pyogenic infections. {ECO:0000269|PubMed:12562389, ECO:0000269|PubMed:17018561, ECO:0000269|PubMed:8613545}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Maküla Dejenerasyonu, Yaş İle İlişkili, 14, Düşük Risk, 615489 (CFB geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 14, reduced risk of, 615489 (CFB gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CFB	CFB, BF, GBG, AHUS4, ARMD14, CFBD	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hemolytic uremic syndrome atypical 4 (AHUS4) [MIM:612924]: An atypical form of hemolytic uremic syndrome. It is a complex genetic disease characterized by microangiopathic hemolytic anemia, thrombocytopenia, renal failure and absence of episodes of enterocolitis and diarrhea. In contrast to typical hemolytic uremic syndrome, atypical forms have a poorer prognosis, with higher death rates and frequent progression to end-stage renal disease. {ECO:0000269|PubMed:17182750, ECO:0000269|PubMed:20513133}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry. Susceptibility to the development of atypical hemolytic uremic syndrome can be conferred by mutations in various components of or regulatory factors in the complement cascade system. Other genes may play a role in modifying the phenotype.	EDTA Blood Sample
Maküla Dejenerasyonu, Yaş İle İlişkili, 14, Düşük Risk, 615489; ARMD14 (İmmün Yetmezlik, Klasik Komponent Yolağı Kompleman Etkinliğine Bağlı) (C2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 14, reduced risk of, 615489; ARMD14 (Immunodeficiency due to a classical component pathway complement deficiency) (C2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	C2	C2, ARMD14	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Complement component 2 deficiency (C2D) [MIM:217000]: A rare defect of the complement classical pathway associated with the development of autoimmune disorders, mainly systemic lupus erythematosus. Skin and joint manifestations are common and renal disease is relatively rare. Patients with complement component 2 deficiency are also reported to have recurrent invasive infections. {ECO:0000269|PubMed:8621452, ECO:0000269|PubMed:9670930}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Maküla Dejenerasyonu, Yaş İle İlişkili, 15, Yatkınlık, 615591; ARMD15 (C9 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 15, susceptibility to, 615591; ARMD15 (C9 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	C9	C9, C9D, ARMD15	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Complement component 9 deficiency (C9D) [MIM:613825]: A rare defect of the complement classical pathway associated with susceptibility to severe recurrent infections predominantly by Neisseria gonorrhoeae or Neisseria meningitidis. Some patients may develop dermatomyositis. {ECO:0000269	PubMed:9634479}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.	EDTA Blood Sample
Maküla Dejenerasyonu, Yaş İle İlişkili, 2, 153800, Otozomal Dominant; ARMD2 (Stargardt Hastalığı) (ABCA4 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 2, 153800, Autosomal dominant; ARMD2 (Stargardt disease) (ABCA4 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ABCA4	ABCA4, ABCR, STGD1, FFM, RP19, CORD3, ARMD2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Macular degeneration, age-related, 2 (ARMD2) [MIM:153800]: A form of age-related macular degeneration, a multifactorial eye disease and the most common cause of irreversible vision loss in the developed world. In most patients, the disease is manifest as ophthalmoscopically visible yellowish accumulations of protein and lipid that lie beneath the retinal pigment epithelium and within an elastin-containing structure known as Bruch membrane. {ECO:0000269|PubMed:19028736, ECO:0000269|PubMed:9295268}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.	EDTA Blood Sample
Maküla Dejenerasyonu, Yaş İle İlişkili, 3, 608895, Otozomal Dominant (Kalıtsal Sensorimotor Nöropati-Hiperelastik Deri) (FBLN5 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 3, 608895, Autosomal dominant (Hereditary sensorimotor neuropathy with hyperelastic skin) (FBLN5 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	FBLN5	FBLN5, ARMD3, ADCL2, ARCL1A, HNARMD	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Cutis laxa, autosomal recessive, 1A (ARCL1A) [MIM:219100]: A connective tissue disorder characterized by loose, hyperextensible skin with decreased resilience and elasticity leading to a premature aged appearance. Face, hands, feet, joints, and torso may be differentially affected. The clinical spectrum of autosomal recessive cutis laxa is highly heterogeneous with respect to organ involvement and severity. Type I autosomal recessive cutis laxa is a specific, life-threatening disorder with organ involvement, lung aelectasis and emphysema, diverticula of the gastrointestinal and genitourinary systems, and vascular anomalies. Associated cranial anomalies, late closure of the fontanel, joint laxity, hip dislocation, and inguinal hernia have been observed but are uncommon. {ECO:0000269|PubMed:12189163, ECO:0000269|PubMed:16652333, ECO:0000269|PubMed:16691202, ECO:0000269|PubMed:17035250, ECO:0000269|PubMed:18185537}. Note=The disease is caused by mutations affecting the gene represented in this entry. Mutations affecting this gene can modify the phenotype of diseases caused by ELN mutations. {ECO:0000269|PubMed:19194475}.	EDTA Blood Sample
Maküla Dejenerasyonu, Yaş İle İlişkili, 4, 610698; ARMD4 (CFH geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 4, 610698; ARMD4 (CFH gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CFH	CFH, HF1, HUS, ARMD4, AHUS1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hemolytic uremic syndrome atypical 1 (AHUS1) [MIM:235400]: An atypical form of hemolytic uremic syndrome. It is a complex genetic disease characterized by microangiopathic hemolytic anemia, thrombocytopenia, renal failure and absence of episodes of enterocolitis and diarrhea. In contrast to typical hemolytic uremic syndrome, atypical forms have a poorer prognosis, with higher death rates and frequent progression to end-stage renal disease. {ECO:0000269|PubMed:10577907, ECO:0000269|PubMed:10762557, ECO:0000269|PubMed:11851332, ECO:0000269|PubMed:12960213, ECO:0000269|PubMed:14583443, ECO:0000269|PubMed:14978182, ECO:0000269|PubMed:20513133, ECO:0000269|PubMed:9551389}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry. Other genes may play a role in modifying the phenotype.	EDTA Blood Sample
Maküla Dejenerasyonu, Yaş İle İlişkili, 4, 610698; ARMD4 (MLPA)	Macular degeneration, age-related, 4, 610698; ARMD4 (MLPA)	CFH	CFH, HF1, HUS, ARMD4, AHUS1	MLPA (CNV)	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	DISEASE: Hemolytic uremic syndrome atypical 1 (AHUS1) [MIM:235400]: An atypical form of hemolytic uremic syndrome. It is a complex genetic disease characterized by microangiopathic hemolytic anemia, thrombocytopenia, renal failure and absence of episodes of enterocolitis and diarrhea. In contrast to typical hemolytic uremic syndrome, atypical forms have a poorer prognosis, with higher death rates and frequent progression to end-stage renal disease. {ECO:0000269|PubMed:10577907, ECO:0000269|PubMed:10762557, ECO:0000269|PubMed:11851332, ECO:0000269|PubMed:12960213, ECO:0000269|PubMed:14583443, ECO:0000269|PubMed:14978182, ECO:0000269|PubMed:20513133, ECO:0000269|PubMed:9551389}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry. Other genes may play a role in modifying the phenotype.	EDTA Blood Sample
Maküla Dejenerasyonu, Yaş İle İlişkili, 6, 613757; ARMD6 (Progresif Kon Distrofisi) (RAX2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 6, 613757; ARMD6 (Cone rod dystrophy) (RAX2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	RAX2	RAX2, RAXL1, QRX, CORD11, ARMD6	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Cone-rod dystrophy 11 (CORD11) [MIM:610381]: An inherited retinal dystrophy characterized by retinal pigment deposits visible on fundus examination, predominantly in the macular region, and initial loss of cone photoreceptors followed by rod degeneration. This leads to decreased visual acuity and sensitivity in the central visual field, followed by loss of peripheral vision. Severe loss of vision occurs earlier than in retinitis pigmentosa. {ECO:0000269	PubMed:15228672}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Maküla Dejenerasyonu, Yaş İle İlişkili, 603075, Otozomal Dominant (APOE geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 603075, Autosomal dominant (APOE gene) (Sequence Analysis-All Coding Exons) (Postnatal)	APOE	APOE, AD2, LPG, LDLCQ5	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Alzheimer disease 2 (AD2) [MIM:104310]: A late-onset neurodegenerative disorder characterized by progressive dementia, loss of cognitive abilities, and deposition of fibrillar amyloid proteins as intraneuronal neurofibrillary tangles, extracellular amyloid plaques and vascular amyloid deposits. The major constituent of these plaques is the neurotoxic amyloid-beta-APP 40-42 peptide (s), derived proteolytically from the transmembrane precursor protein APP by sequential secretase processing. The cytotoxic C-terminal fragments (CTFs) and the caspase-cleaved products such as C31 derived from APP, are also implicated in neuronal death. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry. The APOE*4 allele is genetically associated with the common late onset familial and sporadic forms of Alzheimer disease. Risk for AD increased from 20% to 90% and mean age at onset decreased from 84 to 68 years with increasing number of APOE*4 alleles in 42 families with late onset AD. Thus APOE*4 gene dose is a major risk factor for late onset AD and, in these families, homozygosity for APOE*4 was virtually sufficient to cause AD by age 80. The mechanism by which APOE*4 participates in pathogenesis is not known.	EDTA Blood Sample
Maküla Dejenerasyonu, Yaş İle İlişkili, 7, 610149; ARMD7 (HTRA1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, age-related, 7, 610149; ARMD7 (HTRA1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	HTRA1	HTRA1, PRSS11, ARMD7, CARASIL, CADASIL2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Cerebral arteriopathy, autosomal recessive, with subcortical infarcts and leukoencephalopathy (CARASIL) [MIM:600142]: A cerebrovascular disease characterized by non-hypertensive arteriopathy of cerebral small vessels with subcortical infarcts, alopecia, and spondylosis. Small cerebral arteries show arteriosclerotic changes, fibrous intimal proliferation, and hyaline degeneration with splitting of the intima and/or the internal elastic membrane. Neurologic features include progressive dementia, gait disturbances, extrapyramidal and pyramidal signs, and demyelination of the cerebral white matter with sparing of U fibers. {ECO:0000269	PubMed:19387015}. There is delayed neural development and severe progressive neurologic degeneration resulting in mental retardation. Two clinical forms are recognized: in the classical form or Cockayne syndrome type 1, the symptoms are progressive and typically become apparent within the first few years or life; the less common Cockayne syndrome type 2 is characterized by more severe symptoms that manifest prenatally. Cockayne syndrome shows some overlap with certain forms of xeroderma pigmentosum. Unlike xeroderma pigmentosum, patients with Cockayne syndrome do not manifest increased freckling and other pigmentation abnormalities in the skin and have no significant increase in skin cancer. {ECO:0000269|PubMed:19894250, ECO:0000269|PubMed:3443879}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample

Maküla Dejenerasyonu, X'e Bağlı Atrofik, 300834, X'e Bağlı Resesif (Progresif Kon Distrofisi) (RPGR geni) (Tüm Gen Dizi Analizi) (Postnatal)	Macular degeneration, X-linked atrophic, 300834, X-linked recessive (Cone rod dystrophy) (RPGR gene) (Sequence Analysis-All Coding Exons) (Postnatal)	RPGR	RPGR, RP3, CRD, RP15, COD1, CORDX1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Retinitis pigmentosa 3 (RP3) [MIM:300029]: A X-linked retinal dystrophy belonging to the group of pigmentary retinopathies. Retinitis pigmentosa is characterized by retinal pigment deposits visible on fundus examination and primary loss of rod photoreceptor cells followed by secondary loss of cone photoreceptors. Patients typically have night vision blindness and loss of midperipheral visual field. As their condition progresses, they lose their far peripheral visual field and eventually central vision as well. In RP3, affected males have a severe phenotype, and carrier females show a wide spectrum of clinical features ranging from completely asymptomatic to severe retinitis pigmentosa. Heterozygous women can manifest a form of choroidoretinal degeneration which is distinguished from other types by the absence of visual defects in the presence of a brilliant, scintillating, golden-colored, patchy appearance most striking around the macula, called a tapetal-like retinal reflex. {ECO:0000269|PubMed:10482958, ECO:0000269|PubMed:10737996, ECO:0000269|PubMed:10932196, ECO:0000269|PubMed:10937588, ECO:0000269|PubMed:10970770, ECO:0000269|PubMed:11180598, ECO:0000269|PubMed:11992260, ECO:0000269|PubMed:12657579, ECO:0000269|PubMed:14564670, ECO:0000269|PubMed:9671101, ECO:0000269|PubMed:8817343, ECO:0000269|PubMed:9399904, ECO:0000269|PubMed:9855182}. Both clinical and histological variability is observed. Affected individuals typically display hypotonia and proximal muscle weakness in infancy, leading to the delay of motor milestones. The clinical course of the disorder is usually slow or nonprogressive in adulthood, and the severity of the symptoms may vary from normal to significant muscle weakness. Microscopic examination of CCD-affected skeletal muscle reveals a predominance of type I fibers containing amorphous-looking areas (cores) that do not stain with oxidative and phosphorylase histochemical techniques. {ECO:0000269|PubMed:10051009, ECO:0000269|PubMed:10097181, ECO:0000269|PubMed:11113224, ECO:0000269|PubMed:11709545, ECO:0000269|PubMed:11741831, ECO:0000269|PubMed:12112081, ECO:0000269|PubMed:12136074, ECO:0000269|PubMed:12565913, ECO:0000269|PubMed:12566385, ECO:0000269|PubMed:12937085, ECO:0000269|PubMed:14670767, ECO:0000269|PubMed:14985404, ECO:0000269|PubMed:17204054, ECO:0000269|PubMed:17226826, ECO:0000269|PubMed:18253926, ECO:0000269|PubMed:18312400, ECO:0000269|PubMed:20142353, ECO:0000269|PubMed:21674524, ECO:0000269|PubMed:23558838, ECO:0000269|PubMed:24561095. Akçaağaç Şurubu Hastalığı, Hafif Varyant, 615135; MSUDMV (Akçaağaç Şurubu İdrar Hastalığı) (PPM1K geni) (Tüm Gen Dizi Analizi) (Postnatal)	Maple syrup urine disease, mild variant, 615135; MSUDMV (Maple syrup urine disease) (PPM1K gene) (Sequence Analysis-All Coding Exons) (Postnatal)	PPM1K	PPM1K, PP2CM, PTMP, MSUDMV	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Maple syrup urine disease, mild variant (MSUDMV) [MIM:615135]: A mild form of maple syrup urine disease, a metabolic disorder due to an enzyme defect in the catabolic pathway of the branched-chain amino acids leucine, isoleucine, and valine. Accumulation of these 3 amino acids and their corresponding keto acids leads to encephalopathy and progressive neurodegeneration. Clinical features include mental and physical retardation, feeding problems, and a maple syrup odor to the urine. The keto acids of the branched-chain amino acids are present in the urine. If untreated, maple syrup urine disease can lead to seizures, coma, and death. The disease is often classified by its pattern of signs and symptoms. The most common and severe form of the disease is the classic type, which becomes apparent soon after birth. Variant forms of the disorder become apparent later in infancy or childhood and are typically milder, but they still involve developmental delay and other medical problems if not treated. MSUDMV is characterized by increased plasma levels of branched-chain amino acids (BCAA) apparent at birth. Treatment with a low-protein diet free of BCAA can result in normal psychomotor development and lack of metabolic episodes. {ECO:0000269|PubMed:23086801}. Note=The gene represented in this entry is involved in disease pathogenesis.;	EDTA Blood Sample

The most common and severe form of the disease is the classic type, which becomes apparent soon after birth. Variant forms of the disorder become apparent later in infancy or childhood and are typically milder, but they still involve developmental delay and other medical problems if not treated. {ECO:0000269|PubMed:1847055, ECO:0000269|PubMed:9621512}. Akçaağaç Şurubu İdrar Hastalığı, Tip 2, 248600, Otozomal Resesif (Akçaağaç Şurubu İdrar Hastalığı (Prenatal) (DBT geni) (Tüm Gen Dizi Analizi) (Prenatal)	Maple syrup urine disease, type II, 248600, Autosomal recessive (Maple syrup urine disease) (DBT gene) (Sequence Analysis-All Coding Exons) (Prenatal)	DBT	DBT, BCATE2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	Amniyon sıvısı / CVS / Heparinli ve EDTA'lı (İKİSİ BİRDEN) kordon kanı VE ANNEDEN EDTA'LI KAN		.	.	15	30	20	Prenatal	DISEASE: Maple syrup urine disease 2 (MSUD2) [MIM:248600]: A metabolic disorder due to an enzyme defect in the catabolic pathway of the branched-chain amino acids leucine, isoleucine, and valine. Accumulation of these 3 amino acids and their corresponding keto acids leads to encephalopathy and progressive neurodegeneration. Clinical features include mental and physical retardation, feeding problems, and a maple syrup odor to the urine. The keto acids of the branched-chain amino acids are present in the urine. If untreated, maple syrup urine disease can lead to seizures, coma, and death. The disease is often classified by its pattern of signs and symptoms. The most common and severe form of the disease is the classic type, which becomes apparent soon after birth. Variant forms of the disorder become apparent later in infancy or childhood and are typically milder, but they still involve developmental delay and other medical problems if not treated. {ECO:0000269|PubMed:1847055, ECO:0000269|PubMed:9621512}. Radiologic features include delayed bone age, cone-shaped epiphyses, shortened long tubular bones, and ovoid vertebral bodies. Affected individuals have distinct facial features, including round face, well-defined eyebrows, long eyelashes, bulbous nose with anteverted nostrils, long and prominent philtrum, and thick lips with a small mouth. Other characteristic features include hoarse voice and pseudomuscular build, and there are distinct skeletal features as well, including an internal notch of the femoral head, internal notch of the second metacarpal, and external notch of the fifth metacarpal. {ECO:0000269	PubMed:21683322}. It often presents with multiple tumors appearing at different times and at different sites in the bladder. Most bladder cancers are transitional cell carcinomas that begin in cells that normally make up the inner lining of the bladder. Other types of bladder cancer include squamous cell carcinoma (cancer that begins in thin, flat cells) and adenocarcinoma (cancer that begins in cells that make and release mucus and other fluids). Bladder cancer is a complex disorder with both genetic and environmental influences. {ECO:0000269|PubMed:6298635, ECO:0000269|PubMed:6844927}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.	EDTA Blood Sample
Melanom ve Sinir Sistemi Tümör Sendromu-Melanoma-Astrositoma Sendromu, 155755; Otozomal Dominant (Melanom ve Sinir Sistemi Tümör Sendromu) (CDKN2A geni) (Tüm Gen Dizi Analizi) (Postnatal)	Melanoma and neural system tumor syndrome-MELANOMA-ASTROCYTOMA SYNDROME, 155755, Autosomal dominant (Melanoma and neural system tumor syndrome) (CDKN2A gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CDKN2A	CDKN2A, MTS1, P16, MLM, CMM2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Li-Fraumeni syndrome (LFS) [MIM:151623]: Autosomal dominant familial cancer syndrome that in its classic form is defined by the existence of a proband affected by a sarcoma before 45 years with a first degree relative affected by any tumor before 45 years and another first degree relative with any tumor before 45 years or a sarcoma at any age. Other clinical definitions for LFS have been proposed (PubMed:8118819 and PubMed:8718514) and called Li-Fraumeni like syndrome (LFL). In these families affected relatives develop a diverse set of malignancies at unusually early ages. Four types of cancers account for 80% of tumors occurring in TP53 germline mutation carriers: breast cancers, soft tissue and bone sarcomas, brain tumors (astrocytomas) and adrenocortical carcinomas. Less frequent tumors include choroid plexus carcinoma or papilloma before the age of 15, rhabdomyosarcoma before the age of 5, leukemia, Wilms tumor, malignant phyllodes tumor, colorectal and gastric cancers. {ECO:0000269|PubMed:10484981}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample

Distal spinal muscular atrophy, also known as distal hereditary motor neuronopathy, represents a heterogeneous group of neuromuscular disorders caused by selective degeneration of motor neurons in the anterior horn of the spinal cord, without sensory deficit in the posterior horn. The overall clinical picture consists of a classical distal muscular atrophy syndrome in the legs without clinical sensory loss. The disease starts with weakness and wasting of distal muscles of the anterior tibial and peroneal compartments of the legs. Later on, weakness and atrophy may expand to the proximal muscles of the lower limbs and/or to the distal upper limbs. {ECO:0000269	PubMed:20170900}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample

MRT37 patients manifest delayed global development with speech delay, hypotonia, spasticity, and a sleep disorder. Severe behavioral abnormalities include aggression, hyperactivity, and grinding of the teeth. Note=The disease is caused by mutations affecting the gene represented in this entry. A homozygous deletion in ANK3 predicted to result in frameshift and premature truncation, has been shown to be the cause of moderate intellectual disability, an ADHD-like phenotype and behavioral problems in a consanguineous family (PubMed:23390136). {ECO:0000269	PubMed:23390136}.;	EDTA Blood Sample

The clinical triad consists of short neck, low posterior hairline, and limited neck movement. (ECO:0000269	PubMed:19864492). Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample

Mikroftalmi, İzole 8, 615113, Otozomal Resesif; MCOP8 (İzole Anoftalmi-Mikroftalmi Sendromu) (ALDH1A3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Microphthalmia, isolated 8, 615113, Autosomal recessive; MCOP8 (Isolated anophthalmia-microphthalmia syndrome) (ALDH1A3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ALDH1A3	ALDH1A3, ALDH6, MCOP8	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
Mikroftalmi,İzole, Koloboın 10, 616428, Otozomal Dominant; MCOPCB10 (Kolobomatöz Mikroftalmi) (RBP4 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Microphthalmia, isolated, with coloboma 10, 616428, Autosomal dominant; MCOPCB10 (Colobomatous microphthalmia) (RBP4 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	RBP4	RBP4, RDCCAS, MCOPCB10	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Retinal dystrophy, iris coloboma, and comedogenic acne syndrome (RDCCAS) [MIM:615147]: A disease characterized by retinal degeneration, ocular colobomas involving both the anterior and posterior segment, impaired night vision and loss of visual acuity. Additional characteristic features include developmental abnormalities and severe acne. {ECO:0000269|PubMed:23189188, ECO:0000269|PubMed:9888420}. Note=The disease is caused by mutations affecting the gene represented in this entry. Loss of functional RBP4 protein results in serum retinol deficiency. Lack of normal levels of retinol impairs the visual cycle leading to night blindness at early stages; prolonged deficiency may lead to retinal degeneration. Additionally, retinol deficiency may result in dry skin, increased susceptibility to infection and acne (PubMed:23189188). {ECO:0000269|PubMed:23189188}.	EDTA Blood Sample
Mikroftalmi, İzole-Koloboma 3, İzole Edinilmiş, Mcopcb3 (Kolobomatöz Mikroftalmi) (VSX2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	MICROPHTHALMIA, ISOLATED, WITH COLOBOMA 3; MCOPCB3 (Colobomatous microphthalmia) (VSX2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	VSX2	CHX10, HOX10, MCOP2, MCOPCB3	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Microphthalmia with cataracts and iris abnormalities (MCOPCTI) [MIM:610092]: A disorder of eye formation, ranging from small size of a single eye to complete bilateral absence of ocular tissues. Ocular abnormalities like opacities of the cornea and lens, scaring of the retina and choroid, cataract and other abnormalities like cataract may also be present. {ECO:0000269	PubMed:10932181}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Mikroftalmi, İzole-Koloboma 6, İzole Edinilmiş, Mcopcb6 (Kolobomatöz Mikroftalmi) (GDF6 geni) (Tüm Gen Dizi Analizi) (Postnatal)	MICROPHTHALMIA, ISOLATED, WITH COLOBOMA 6; MCOPCB6 (Colobomatous microphthalmia) (GDF6 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	GDF6	GDF6, MCOP4, KFS1, MCOPCB6, LCA17	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Klippel-Feil syndrome 1, autosomal dominant (KFS1) [MIM:118100]: A skeletal disorder characterized by congenital fusion of cervical vertebrae. It is due to a failure in the normal segmentation of vertebrae during the early weeks of fetal development. The clinical triad consists of short neck, low posterior hairline, and limited neck movement. Deafness is a feature in some cases and may be of sensorineural, conductive, or mixed type. {ECO:0000269|PubMed:18425797, ECO:0000269|PubMed:19129173}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Mikroftalmi, Koloborn 7, İzole, 614497, Otozomal Dominant; MCOPCB7 (Kolobomatöz Mikroftalmi) (ABCB6 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Microphthalmia, isolated, with coloboma 7, 614497, Autosomal dominant; MCOPCB7 (Colobomatous microphthalmia) (ABCB6 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ABCB6	ABCB6, MTABC3, MCOPCB7, LAN, DUH3, PSHK2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Microphthalmia, isolated, with coloboma, 7 (MCOPCB7) [MIM:614497]: A disorder of eye formation, ranging from small size of a single eye to complete bilateral absence of ocular tissues. Ocular abnormalities like opacities of the cornea and lens, scaring of the retina and choroid, and other abnormalities may also be present. Ocular colobomas are a set of malformations resulting from abnormal morphogenesis of the optic cup and stalk, and the fusion of the fetal fissure (optic fissure). {ECO:0000269	PubMed:22226084}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Mikroftalmi, Koloborn 8, 601186, Otozomal Resesif İle İzole (Matthew-Wood Sendromu) (STRA6 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Microphthalmia, isolated, with coloboma 8, 601186, Autosomal recessive (Matthew-Wood syndrome) (STRA6 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	STRA6	STRA6, MCOPS9, MCOPCB8	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Microphthalmia, syndromic, 9 (MCOPS9) [MIM:601186]: A rare clinical entity including as main characteristics anophthalmia or severe microphthalmia, and pulmonary hypoplasia or aplasia. Microphthalmia is a disorder of eye formation, ranging from small size of a single eye to complete bilateral absence of ocular tissues (anophthalmia). In many cases, microphthalmia/anophthalmia occurs in association with syndromes that include non-ocular abnormalities. {ECO:0000269|PubMed:17273977, ECO:0000269|PubMed:17503335, ECO:0000269|PubMed:21901792}. (Diyabetin Mikrovasküler Komplikasyonları 3), 612624 (ACE geni) (Tüm Gen Dizi Analizi) (Postnatal)	Microvascular complications of diabetes 3, 612624 (ACE gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ACE	ACE, DCP1, ACE1, MVCD3, ICH	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Renal tubular dysgenesis (RTD) [MIM:267430]: Autosomal recessive severe disorder of renal tubular development characterized by persistent fetal anuria and perinatal death, probably due to pulmonary hypoplasia from early-onset oligohydramnios (the Potter phenotype). {ECO:0000269	PubMed:16116425}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Diyabetin Mikrovasküler Komplikasyonları 4, 612628 (IL1RN geni) (Tüm Gen Dizi Analizi) (Postnatal)	Microvascular complications of diabetes 4, 612628 (IL1RN gene) (Sequence Analysis-All Coding Exons) (Postnatal)	IL1RN	IL1RN, MVCD4, DIRA	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Interleukin 1 receptor antagonist deficiency (DIRA) [MIM:612852]: A rare autoinflammatory disease of skin and bone resulting in sterile multifocal osteomyelitis, periostitis, and pustulosis from birth. The term autoinflammatory disease describes a group of disorders characterized by attacks of seemingly unprovoked inflammation without significant levels of autoantibodies and autoreactive T-cells. {ECO:0000269	PubMed:19494218}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Diyabetin Mikrovasküler Komplikasyonları 5, 612633 (PON1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Microvascular complications of diabetes 5, 612633 (PON1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	PON1	PON1, PON, ESA, MVCD5	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Microvascular complications of diabetes 5 (MVCD5) [MIM:612633]: Pathological conditions that develop in numerous tissues and organs as a consequence of diabetes mellitus. They include diabetic retinopathy, diabetic nephropathy leading to end-stage renal disease, and diabetic neuropathy. Diabetic retinopathy remains the major cause of new-onset blindness among diabetic adults. It is characterized by vascular permeability and increased tissue ischemia and angiogenesis. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry. Homozygosity for the Leu-55 allele is strongly associated with the development of retinal disease in diabetic patients.;	EDTA Blood Sample
(Diyabetin Mikrovasküler Komplikasyonları 6), 612634 (SOD2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Microvascular complications of diabetes 6, 612634 (SOD2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	SOD2	SOD2, MNSOD, MVCD6	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Microvascular complications of diabetes 6 (MVCD6) [MIM:612634]: Pathological conditions that develop in numerous tissues and organs as a consequence of diabetes mellitus. They include diabetic retinopathy, diabetic nephropathy leading to end-stage renal disease, and diabetic neuropathy. Diabetic retinopathy remains the major cause of new-onset blindness among diabetic adults. It is characterized by vascular permeability and increased tissue ischemia and angiogenesis. {ECO:0000269	PubMed:12624725}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.;	EDTA Blood Sample
Diyabetin Mikrovasküler Komplikasyonları 7, 612635 (HFE geni) (Tüm Gen Dizi Analizi) (Postnatal)	Microvascular complications of diabetes 7, 612635 (HFE gene) (Sequence Analysis-All Coding Exons) (Postnatal)	HFE	HFE, HLA-H, HFE1, MVCD7, TFQTL2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Variegate porphyria (VP) [MIM:176200]: A form of porphyria. Porphyrias are inherited defects in the biosynthesis of heme, resulting in the accumulation and increased excretion of porphyrins or porphyrin precursors. They are classified as erythropoietic or hepatic, depending on whether the enzyme deficiency occurs in red blood cells or in the liver. Variegate porphyria is the most common form of porphyria in South Africa. It is characterized by skin hyperpigmentation and hypertrichosis, abdominal pain, tachycardia, hypertension and neuromuscular disturbances. High fecal levels of protoporphyrin and coproporphyrin, increased urine uroporphyrins and iron overload are typical markers of the disease. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry. Iron overload due to HFE variants is a precipitating or exacerbating factor in variegate porphyria.	EDTA Blood Sample
Mikrovillus İnklüzyon Hastalığı, 251850, Otozomal Resesif (Mikrovillus İnklüzyon Hastalığı) (MYO5B geni) (Tüm Gen Dizi Analizi) (Postnatal)	Microvillus inclusion disease, 251850, Autosomal recessive (Microvillus inclusion disease) (MYO5B gene) (Sequence Analysis-All Coding Exons) (Postnatal)	MYO5B	MYO5B, KIAA1119	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Diarrhea 2, with microvillus atrophy (DIAR2) [MIM:251850]: A disease characterized by onset of intractable life-threatening watery diarrhea during infancy. Two forms are recognized: early-onset microvillus inclusion disease with diarrhea beginning in the neonatal period, and late-onset, with first symptoms appearing after 3 or 4 months of life. {ECO:0000269|PubMed:18724368, ECO:0000269|PubMed:19006234, ECO:0000269|PubMed:20186687, ECO:0000269|PubMed:21206382, ECO:0000269|PubMed:24138727, ECO:0000269|PubMed:24892806}. Migren, ± Aura, Yatkınlık 12, 13, 613656 (KCNK18 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Migraine, with or without aura, susceptibility to, 13, 613656 (KCNK18 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	KCNK18	KCNK18, TRESK, TRIK, MGR13	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Migraine with or without aura 13 (MGR13) [MIM:613656]: A form of migraine transmitted in an autosomal dominant pattern. Migraine is a disabling symptom complex of periodic headaches, usually temporal and unilateral. Headaches are often accompanied by irritability, nausea, vomiting and photophobia, preceded by constriction of the cranial arteries. The two major subtypes are common migraine (migraine without aura) and classic migraine (migraine with aura). Classic migraine is characterized by recurrent attacks of reversible neurological symptoms (aura) that precede or accompany the headache. Aura may include a combination of sensory disturbances, such as blurred vision, hallucinations, vertigo, numbness and difficulty in concentrating and speaking. {ECO:0000269|PubMed:20871611}. Note=The disease is caused by mutations affecting the gene represented in this entry. Susceptibility to migraine has been shown to be conferred by a frameshift mutation that segregates with the disorder in a large multigenerational family. Migraine was associated with sensitivity to lights, sounds, and smells, as well as nausea and occasional vomiting. Triggers included fatigue, alcohol and bright lights. Mutations in KCNK18 are a rare cause of migraine.;	EDTA Blood Sample

This includes hematological malignancies, central nervous system tumors, Lynch syndrome-associated malignancies such as colorectal tumors as well as multiple intestinal polyps, embryonic tumors and rhabdomyosarcoma. Multiple cafe-au-lait macules, a feature reminiscent of neurofibromatosis type 1, are often found as first manifestation of the underlying cancer. Areas of skin hypopigmentation have also been reported in MMRCS patients. {ECO:0000269	PubMed:17557300}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Mismatch Repair Kanser Sendromu, 276300, Otozomal Resesif (Konstitüsyonel Mismatch Onarım Eksikliği Sendromu) (MLPA)	Mismatch repair cancer syndrome, 276300, Autosomal recessive (Constitutional mismatch repair deficiency syndrome) (MLPA)	MSH2	MSH2, COCA1, FCC1, HNPCC1	MLPA (CNV)	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	DISEASE: Hereditary non-polyposis colorectal cancer 1 (HNPCC1) [MIM:120435]: An autosomal dominant disease associated with marked increase in cancer susceptibility. It is characterized by a familial predisposition to early-onset colorectal carcinoma (CRC) and extra-colonic tumors of the gastrointestinal, urological and female reproductive tracts. HNPCC is reported to be the most common form of inherited colorectal cancer in the Western world. Clinically, HNPCC is often divided into two subgroups. Type I is characterized by hereditary predisposition to colorectal cancer, a young age of onset, and carcinoma observed in the proximal colon. Type II is characterized by increased risk for cancers in certain tissues such as the uterus, ovary, breast, stomach, small intestine, skin, and larynx in addition to the colon. Diagnosis of classical HNPCC is based on the Amsterdam criteria: 3 or more relatives affected by colorectal cancer, one a first degree relative of the other two; 2 or more generation affected; 1 or more colorectal cancers presenting before 50 years of age; exclusion of hereditary polyposis syndromes. The term 'suspected HNPCC' or 'incomplete HNPCC' can be used to describe families who do not or only partially fulfill the Amsterdam criteria, but in whom a genetic basis for colon cancer is strongly suspected. {ECO:0000269|PubMed:10375096, ECO:0000269|PubMed:10386556, ECO:0000269|PubMed:10528862, ECO:0000269|PubMed:10573010, ECO:0000269|PubMed:10612836, ECO:0000269|PubMed:10777691, ECO:0000269|PubMed:10829038, ECO:0000269|PubMed:11726306, ECO:0000269|PubMed:11870161, ECO:0000269|PubMed:11920458	EDTA Blood Sample

In a minority of cases, it is associated with skeletal myopathy, which predominantly involves axial or proximal muscles and which causes abnormal fatigability and even permanent muscle weakness. Ragged-red fibers and atrophy are found on muscle biopsy. A large proportion of chronic ophthalmoplegias are associated with other symptoms, leading to a multisystemic pattern of this disease. Additional symptoms are variable, and may include cataracts, hearing loss, sensory axonal neuropathy, ataxia, depression, hypogonadism, and parkinsonism. {ECO:0000269|PubMed:12210792, ECO:0000269|PubMed:15351195, ECO:0000269|PubMed:15534189, ECO:0000269|PubMed:17420318, ECO:0000269|PubMed:18575922}. It is associated with mitral regurgitation. Myxomatous mitral valves have an abnormal layered architecture characterized by loose collagen in fibrosa, expanded spongiosa strongly positive for proteoglycans, and disrupted elastin in atrialis. In classic mitral valve prolapse, leaflets are at least 5 mm thick, whereas in the non-classic form, they are less than 5 mm thick. Severe classic mitral valve prolapse is strongly associated with arrhythmias, endocarditis, heart failure, and need for valve surgery. {ECO:0000269	PubMed:26258302}. Unlike the related diseases, mucolipidosis II and IIIA, the enzyme affected in mucolipidosis IIIC (GlcNAc- phosphotransferase) retains full transferase activity on synthetic substrates but lacks activity on lysosomal hydrolases. Typical clinical findings include stiffness of the hands and shoulders, claw-hand deformity, scoliosis, short stature, coarse facies, and mild mental retardation. Radiographically, severe dysostosis multiplex of the hip is characteristic and frequently disabling. The clinical diagnosis can be confirmed by finding elevated serum lysosomal enzyme levels and/or decreased lysosomal enzyme levels in cultured fibroblasts. {ECO:0000269|PubMed:10712439, ECO:0000269|PubMed:15532026, ECO:0000269|PubMed:24316125}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample
Mukolipidoz 3 Gama, 252605, Otozomal Resesif (Mukolipidoz Tip 3) (Prenatal) (GNPTG geni) (Tüm Gen Dizi Analizi) (Prenatal)	Mucolipidosis III gamma, 252605, Autosomal recessive (Mucolipidosis type III) (GNPTG gene) (Sequence Analysis-All Coding Exons) (Prenatal)	GNPTG	GNPTAG	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	Amniyon sıvısı / CVS / Heparinli ve EDTA'lı (İKİSİ BİRDEN) kordon kanı VE ANNEDEN EDTA'LI KAN		.	.	15	30	20	Prenatal	DISEASE: Mucolipidosis type III complementation group C (ML IIIC) [MIM:252605]: Autosomal recessive disease of lysosomal hydrolase trafficking. Unlike the related diseases, mucolipidosis II and IIIA, the enzyme affected in mucolipidosis IIIC (GlcNAc- phosphotransferase) retains full transferase activity on synthetic substrates but lacks activity on lysosomal hydrolases. Typical clinical findings include stiffness of the hands and shoulders, claw-hand deformity, scoliosis, short stature, coarse facies, and mild mental retardation. Radiographically, severe dysostosis multiplex of the hip is characteristic and frequently disabling. The clinical diagnosis can be confirmed by finding elevated serum lysosomal enzyme levels and/or decreased lysosomal enzyme levels in cultured fibroblasts. {ECO:0000269|PubMed:10712439, ECO:0000269|PubMed:15532026, ECO:0000269|PubMed:24316125}. Note=The disease is caused by mutations affecting the gene represented in this entry.	Amniotic Fluid / CVS / Heparinized and EDTA (BOTH) Fetal Blood and Maternal EDTA Blood Sample
