They are classified as erythropoietic or hepatic, depending on whether the enzyme deficiency occurs in red blood cells or in the liver. Hereditary coproporphyria is an acute hepatic porphyria characterized by skin photosensitivity, attacks of abdominal pain, neurological disturbances, and psychiatric symptoms. Most attacks are precipitated by drugs, alcohol, caloric deprivation, infections, or endocrine factors. Hereditary coproporphyria is biochemically characterized by overexcretion of coproporphyrin III in the urine and in the feces. {ECO:0000269|PubMed:12181641, ECO:0000269|PubMed:15896662, ECO:0000269|PubMed:16398658, ECO:0000269|PubMed:7757079, ECO:0000269|PubMed:7849704, ECO:0000269|PubMed:8012360, ECO:0000269|PubMed:8990017, ECO:0000269|PubMed:9048920, ECO:0000269|PubMed:9298818, ECO:0000269|PubMed:9888388}. Cowden syndrome is characterized by hamartomatous lesions affecting derivatives of ectodermal, mesodermal and endodermal layers, macrocephaly, facial trichilemmomas (benign tumors of the hair follicle infundibulum), acral keratoses, papillomatous papules, and elevated risk for development of several types of malignancy, particularly breast carcinoma in women and thyroid carcinoma in both men and women. Colon cancer and renal cell carcinoma have also been reported. Hamartomas can be found in virtually every organ, but most commonly in the skin, gastrointestinal tract, breast and thyroid. {ECO:0000269|PubMed:21177507}. Note=The gene represented in this entry is involved in disease pathogenesis. Germline KLLN methylation is common among patients with Cowden syndrome or Cowden-like syndrome and is associated with increased risks of breast and renal cancer over PTEN mutation-positive individuals {PubMed:21177507}. {ECO:0000269|PubMed:21177507};. It is characterized by the triad of chronic bronchopulmonary disease (with recurrent respiratory infections), pancreatic insufficiency (which leads to malabsorption and growth retardation) and elevated sweat electrolytes. It is the most common genetic disease in Caucasians, with a prevalence of about 1 in 2'000 live births. Inheritance is autosomal recessive. (ECO:0000269|PubMed:10094564, ECO:0000269|PubMed:1284466, ECO:0000269|PubMed:1284468, ECO:0000269|PubMed:1284529, ECO:0000269|PubMed:1284530, ECO:0000269|PubMed:1695717, ECO:0000269|PubMed:1710600, ECO:0000269|PubMed:2236053, ECO:0000269|PubMed:7504969, ECO:0000269|PubMed:7505694, ECO:0000269|PubMed:7513296, ECO:0000269|PubMed:7517264, ECO:0000269|PubMed:7520022, ECO:0000269|PubMed:7522211, ECO:0000269|PubMed:7524909, ECO:0000269|PubMed:7524913, ECO:0000269|PubMed:7525450, ECO:0000269|PubMed:7537150, ECO:0000269|PubMed:7541273, ECO:0000269|PubMed:7541510, ECO:0000269|PubMed:7543567, ECO:0000269|PubMed:7544319, ECO:0000269|PubMed:7581407,	Amniotic Fluid / CVS / Heparinized and EDTA (BOTH) Fetal Blood and Maternal EDTA Blood Sample

Joint pain, joint deformity, waddling gait, and short stature are the main clinical signs and symptoms. Radiological examination of the skeleton shows delayed, irregular mineralization of the epiphyseal ossification centers and of the centers of the carpal and tarsal bones. Multiple epiphyseal dysplasia is broadly categorized into the more severe Fairbank and the milder Ribbing types. The Fairbank type is characterized by shortness of stature, short and stubby fingers, small epiphyses in several joints, including the knee, ankle, hand, and hip. The Ribbing type is confined predominantly to the hip joints and is characterized by hands that are normal and stature that is normal or near-normal. Multiple epiphyseal dysplasia type 4 is a recessively inherited form, characterized by early childhood-onset hip dysplasia and recurrent patella dislocation. Short stature is not frequent. {ECO:0000269|PubMed:12966518, ECO:0000269|PubMed:21927596}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample

Sağırlık, Otozomal Dominant 9, 601369, Otozomal Dominant; DFNA9 (Otozomal Dominant Sendromik Olmayan Sensorinöral İşitme Kaybı Tipi DFNA) (COCH geni) (Tüm Gen Dizi Analizi) (Postnatal)	Deafness, autosomal dominant 9, 601369, Autosomal dominant; DFNA9 (Autosomal dominant non-syndromic sensorineural deafness type DFNA) (COCH gene) (Sequence Analysis-All Coding Exons) (Postnatal)	COCH	COCH, DFNA9	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Deafness, autosomal dominant, 9 (DFNA9) [MIM:601369]: A form of non-syndromic hearing loss characterized by onset in the fourth or fifth decade of life and initially involves the high frequencies. Hearing loss is progressive and usually complete by the sixth decade. In addition to cochlear involvement, DFNA9 patients also exhibit a spectrum of vestibular dysfunctions. Penetrance of the vestibular symptoms is often incomplete, and some patients are minimally affected, whereas others suffer from severe balance disturbances and episodes of vertigo. Affected individuals have mucopolysaccharide depositions in the channels of the cochlear and vestibular nerves. These depositions apparently cause strangulation and degeneration of dendritic fibers. {ECO:0000269|PubMed:10400989, ECO:0000269|PubMed:11295836, ECO:0000269|PubMed:14512963, ECO:0000269|PubMed:16835021, ECO:0000269|PubMed:17561763, ECO:0000269|PubMed:18312449, ECO:0000269|PubMed:22610276, ECO:0000269|PubMed:22931125, ECO:0000269|PubMed:23983205, ECO:0000269|PubMed:9806553, ECO:0000269|PubMed:9931344}. DHS erythrocytes exhibit decreased total cation and potassium content that are not accompanied by a proportional net gain of sodium and water. DHS patients typically exhibit mild to moderate compensated hemolytic anemia, with an increased erythrocyte mean corpuscular hemoglobin concentration and a decreased osmotic fragility, both of which reflect cellular dehydration. Patients may also show perinatal edema and pseudohyperkalemia due to loss of potassium from red cells stored at room temperature. A minor proportion of red cells appear as stomatocytes on blood films. Complications such as splenomegaly and cholelithiasis, resulting from increased red cell trapping in the spleen and elevated bilirubin levels, respectively, may occur. The course of DHS is frequently associated with iron overload, which may lead to hepatosiderosis. {ECO:0000269|PubMed:26148990, ECO:0000269|PubMed:26178367, ECO:0000269|PubMed:26198474}. Two forms of the disorder are distinguished: type 1 deficiency is additionally characterized by decreased plasminogen antigen levels and clinical symptoms, whereas type 2 deficiency, also known as dysplasminogenemia, is characterized by normal, or slightly reduced antigen levels, and absence of clinical manifestations. Plasminogen deficiency type 1 results in markedly impaired extracellular fibrinolysis and chronic mucosal pseudomembranous lesions due to subepithelial fibrin deposition and inflammation. The most common clinical manifestation of type 1 deficiency is ligneous conjunctivitis in which pseudomembranes formation on the palpebral surfaces of the eye progresses to white, yellow-white, or red thick masses with a wood-like consistency that replace the normal mucosa. {ECO:0000269|PubMed:10233898, ECO:0000269|PubMed:1427790, ECO:0000269|PubMed:1986355, ECO:0000269|PubMed:6216475, ECO:0000269|PubMed:6238949, ECO:0000269|PubMed:8302398, ECO:0000269|PubMed:9242524, ECO:0000269|PubMed:9858247}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample

Distoni-1, Modifiye Edici (Erken Başlangıçlı Jeneralize Ekstremite Başlangıçlı Distoni) (MLPA)	Dystonia-1, modifier of (Early-onset generalized limb-onset dystonia) (MLPA)	TOR1A	DYT1, TOR1A	MLPA (CNV)	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	DISEASE: Dystonia 1, torsion, autosomal dominant (DYT1) [MIM:128100]: A primary torsion dystonia, and the most common and severe form. Dystonia is defined by the presence of sustained involuntary muscle contractions, often leading to abnormal postures. Dystonia type 1 is characterized by involuntary, repetitive, sustained muscle contractions or postures involving one or more sites of the body, in the absence of other neurological symptoms. Typically, symptoms develop first in an arm or leg in middle to late childhood and progress in approximately 30% of patients to other body regions (generalized dystonia) within about five years. 'Torsion' refers to the twisting nature of body movements observed in DYT1, often affecting the trunk. Distribution and severity of symptoms vary widely between affected individuals, ranging from mild focal dystonia to severe generalized dystonia, even within families. {ECO:0000269|PubMed:18477710, ECO:0000269|PubMed:19955557, ECO:0000269|PubMed:9288096). Ektodermal Displazi 7, Saç / Tırnak Tipi, 614929, Otozomal Resesif; ECTD7 (Saf Saç ve Tırnak Ektodermal Displazisi) (Prenatal) (KRT74 geni) (Tüm Gen Dizi Analizi) (Prenatal)	Ectodermal dysplasia 7, hair/nail type, 614929, Autosomal recessive; ECTD7 (Pure hair and nail ectodermal dysplasia) (KRT74 gene) (Sequence Analysis-All Coding Exons) (Prenatal)	KRT74	KRT74, K6IRS4, KRT6IRS4, HTS52, HYPT3, ADWH	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	Amniyon sıvısı / CVS / Heparinli ve EDTA'lı (İKİSİ BİRDEN) kordon kanı VE ANNEDEN EDTA'LI KAN		.	.	15	30	20	Prenatal	DISEASE: Hypotrichosis 3 (HYPT3) [MIM:613981]: A condition characterized by the presence of less than the normal amount of hair. Affected individuals have normal hair in early childhood but experience progressive hair loss limited to the scalp beginning in the middle of the first decade and almost complete baldness by the third decade. Body hair, beard, eyebrows, axillary hair, teeth, and nails develop normally. (ECO:0000269	PubMed:21188418). Note=The disease is caused by mutations affecting the gene represented in this entry.	Amniotic Fluid / CVS / Heparinized and EDTA (BOTH) Fetal Blood and Maternal EDTA Blood Sample
Ektodermal Displazi 9, Saç / Tırnak Tipi, 614931, Otozomal Resesif; ECTD9 (Saf Saç ve Tırnak Ektodermal Displazisi) (HOXC13 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Ectodermal dysplasia 9, hair/nail type, 614931, Autosomal recessive; ECTD9 (Pure hair and nail ectodermal dysplasia) (HOXC13 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	HOXC13	HOXC13, HOX3G, ECTD9	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Ectodermal dysplasia 9, hair/nail type (ECTD9) [MIM:614931]: A form of ectodermal dysplasia, a heterogeneous group of disorders due to abnormal development of two or more ectodermal structures such as hair, teeth, nails and sweat glands, with or without any additional clinical sign. Each combination of clinical features represents a different type of ectodermal dysplasia. ECTD9 is characterized by hypotrichosis and nail dystrophy without non-ectodermal or other ectodermal manifestations. Hypotrichosis usually occurs after birth with varying degrees of severity, ranging from mild hair loss to complete atrichia, including the loss of scalp hair, beard, eyebrows, eyelashes, axillary hair, and pubic hair. Nail dystrophy affects all 20 digits by causing short fragile nails or spoon nails (koilonychia). (ECO:0000269	PubMed:23063621). Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample

Generalized seizures arise diffusely and simultaneously from both hemispheres of the brain. {ECO:0000269|PubMed:19191339}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.	EDTA Blood Sample
Epilepsi, Jüvenil Miyoklonik, Yatkınlık, 5, 611136 (Jüvenil Miyoklonik Epilepsi) (GABRA1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Epilepsy, juvenile myoclonic, susceptibility to, 5, 611136 (Juvenile myoclonic epilepsy) (GABRA1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	GABRA1	GABRA1, EJM5, ECA4, EIEE19	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Epilepsy, childhood absence 4 (ECA4) [MIM:611136]: A subtype of idiopathic generalized epilepsy characterized by an onset at age 6-7 years, frequent absence seizures (several per day) and bilateral, synchronous, symmetric 3-Hz spike waves on EEG. Tonic-clonic seizures often develop in adolescence. Absence seizures may either remit or persist into adulthood. {ECO:0000269|PubMed:16738694}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.	EDTA Blood Sample
Epilepsi, Jüvenil Miyoklonik, Yatkınlık, 613060, Otozomal Dominant (Jüvenil Miyoklonik Epilepsi) (GABRD geni) (Tüm Gen Dizi Analizi) (Postnatal)	Epilepsy, juvenile myoclonic, susceptibility to, 613060, Autosomal dominant (Juvenile myoclonic epilepsy) (GABRD gene) (Sequence Analysis-All Coding Exons) (Postnatal)	GABRD	GABRD, GEFSP5, EIG10, EJM7	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Generalized epilepsy with febrile seizures plus 5 (GEFS+5) [MIM:613060]: A rare autosomal dominant, familial condition with incomplete penetrance and large intrafamilial variability. Patients display febrile seizures persisting sometimes beyond the age of 6 years and/or a variety of afebrile seizure types. This disease combines febrile seizures, generalized seizures often precipitated by fever at age 6 years or more, and partial seizures, with a variable degree of severity. {ECO:0000269|PubMed:15115768}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.	EDTA Blood Sample

Epilepsi, Jüvenil Miyoklonik, Yatkınlık, 8, 607628, Otozomal Dominant (Jüvenil Miyoklonik Epilepsi) (CLCN2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Epilepsy, juvenile myoclonic, susceptibility to, 8, 607628, Autosomal dominant (Juvenile myoclonic epilepsy) (CLCN2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CLCN2	CLCN2, EGMA, ECA2, EGI11, EJM8, LKPAT	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Epilepsy, idiopathic generalized 11 (EIG11) [MIM:607628]: A disorder characterized by recurring generalized seizures in the absence of detectable brain lesions and/or metabolic abnormalities. Generalized seizures arise diffusely and simultaneously from both hemispheres of the brain. {ECO:0000269	PubMed:19191339}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.	EDTA Blood Sample
Epilepsi, Miyoklonik, Allesel Erişkin, 2, 607876, Otozomal Dominant; FAME2 (Benign Yetişkin Allesel Miyoklonik Epilepsi) (ADRA2B geni) (Tüm Gen Dizi Analizi) (Postnatal)	Epilepsy, myoclonic, familial adult, 2, 607876, Autosomal dominant; FAME2 (Benign adult familial myoclonic epilepsy) (ADRA2B gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ADRA2B	ADRA2B, ADRA2L1, FAME2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Epilepsy, familial adult myoclonic, 2 (FAME2) [MIM:607876]: A form of cortical myoclonic tremor with epilepsy, a syndrome characterized by cortical myoclonus and variable occurrence of epileptic seizures. Usually, myoclonic tremor is the presenting symptom, characterized by tremulous finger movements and myoclonic jerks of the limbs increased by action and posture. In a minority of patients, seizures are the presenting symptom; both complex partial as well as generalized tonic clonic seizures are described. Some patients exhibit mild cognitive impairment. {ECO:0000269	PubMed:24114805}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Epilepsi, Miyoklonik, Allesel Yetişkin, 5, 615400, Otozomal Resesif; FAME5 (Benign Yetişkin Allesel Miyoklonik Epilepsi) (CNTN2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Epilepsy, myoclonic, familial adult, 5, 615400, Autosomal recessive; FAME5 (Benign adult familial myoclonic epilepsy) (CNTN2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CNTN2	CNTN2, TAX, TAX1, FAME5	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Epilepsy, familial adult myoclonic, 5 (FAME5) [MIM:615400]: A form of cortical myoclonic tremor with epilepsy, a syndrome characterized by cortical myoclonus and variable occurrence of epileptic seizures. Usually, myoclonic tremor is the presenting symptom, characterized by tremulous finger movements and myoclonic jerks of the limbs increased by action and posture. Epilepsi, Progresif Miyoklonik 2B (Lafora), 254780, Otozomal Resesif (Lafora Hastalığı) (NHLRC1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Epilepsy, progressive myoclonic 2B (Lafora), 254780, Autosomal recessive (Lafora disease) (NHLRC1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NHLRC1	NHLRC1, EPM2A, EPM2B	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Epilepsy, progressive myoclonic 2 (EPM2) [MIM:254780]: An autosomal recessive and severe form of adolescent-onset progressive epilepsy. Typically, as seizures increase in frequency, cognitive function declines towards dementia, and affected individuals die usually within 10 years after onset. EPM2 occurs worldwide, but it is particularly common in the mediterranean countries of southern Europe and northern Africa, in southern India and in the Middle East. At the cellular level, it is characterized by accumulation of starch-like polyglucosans called Lafora bodies (LBs) that are most abundant in organs with the highest glucose metabolism: brain, heart, liver and skeletal muscle. Among other conditions involving polyglucosans, EPM2 is unique in that the inclusions are in neuronal dendrites but not axons and the forming polyglucosan fibrils are associated with the endoplasmic reticulum. {ECO:0000269|PubMed:12958597, ECO:0000269|PubMed:15781812, ECO:0000269|PubMed:16021330, ECO:0000269|PubMed:18311786, ECO:0000269|PubMed:21505799}. Ekzostoz, Multipl, Tip 2, 133701, Otozomal Dominant (Multipl Osteokondroma) (MLPA)	Exostoses, multiple, type 2, 133701, Autosomal dominant (Multiple osteochondromas) (MLPA)	EXT2	EXT2, SSMS	MLPA (CNV)	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	.	EDTA Blood Sample

Eksüdatif Vitreoretinopati 1, 133780, Otozomal Dominant; EVR1 (Allesel Eksudatif Vitreoretinopati) (FZD4 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Exudative vitreoretinopathy 1, 133780, Autosomal dominant; EVR1 (Familial exudative vitreoretinopathy) (FZD4 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	FZD4	FZD4, EVR1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Vitreoretinopathy, exudative 1 (EVR1) [MIM:133780]: A disorder of the retinal vasculature characterized by an abrupt cessation of growth of peripheral capillaries, leading to an avascular peripheral retina. This may lead to compensatory retinal neovascularization, which is thought to be induced by hypoxia from the initial avascular insult. New vessels are prone to leakage and rupture causing exudates and bleeding, followed by scarring, retinal detachment and blindness. Clinical features can be highly variable, even within the same family. Patients with mild forms of the disease are asymptomatic, and their only disease related abnormality is an arc of avascular retina in the extreme temporal periphery. In many ways the disease resembles retinopathy of prematurity but there is no evidence of prematurity or small birth weight in the patient history. (ECO:0000269|PubMed:12172548, ECO:0000269|PubMed:14507768, ECO:0000269|PubMed:15035989, ECO:0000269|PubMed:15223780, ECO:0000269|PubMed:15370539, ECO:0000269|PubMed:15488808, ECO:0000269|PubMed:15733276, ECO:0000269|PubMed:15981244, ECO:0000269|PubMed:17093393, ECO:0000269|PubMed:19172507, ECO:0000269|PubMed:19324941, ECO:0000269|PubMed:20340138). The onset of symptoms usually occurs in the first or second decade of life. Affected individuals usually present with impairment of upper extremity elevation. This tends to be followed by facial weakness, primarily involving the orbicularis oris and orbicularis oculi muscles. {ECO:0000269	PubMed:23143600}. Note=The disease is caused by mutations affecting the gene represented in this entry. SMCHD1 mutations lead to DUX4 expression in somatic tissues, including muscle cells, when an haplotype on chromosome 4 is permissive for DUX4 expression. Ectopic expression of DUX4 in skeletal muscle activates the expression of stem cell and germline genes, and, when overexpressed in somatic cells, DUX4 can ultimately lead to cell death.;	EDTA Blood Sample

It is clinically characterized by anchoring of the eyes in downward gaze, ptosis, and backward tilt of the head. Congenital fibrosis of extraocular muscles type 2 may result from the defective development of the oculomotor (nIII), trochlear (nIV) and abducens (nVI) cranial nerve nuclei. {ECO:0000269	PubMed:11600883}. Note=The disease is caused by mutations affecting the gene represented in this entry.,	EDTA Blood Sample
Ekstraoküler Kas Fibrozis, Konjenital, 3A, 600638, Otozomal Dominant; CFEOM3A (Ekstraoküler Kasların Konjenital Fibrozisi) (TUBB3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Fibrosis of extraocular muscles, congenital, 3A, 600638, Autosomal dominant; CFEOM3A (Congenital fibrosis of extraocular muscles) (TUBB3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TUBB3	TUBB3, TUBB4, CFEOM3A, CDCBM1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Fibrosis of extraocular muscles, congenital, 3A (CFEOM3A) [MIM:600638]: A congenital ocular motility disorder marked by restrictive ophthalmoplegia affecting extraocular muscles innervated by the oculomotor and/or trochlear nerves. It is clinically characterized by anchoring of the eyes in downward gaze, ptosis, and backward tilt of the head. Congenital fibrosis of extraocular muscles type 3 presents as a non-progressive, autosomal dominant disorder with variable expression. Patients may be bilaterally or unilaterally affected, and their oculo-motility defects range from complete ophthalmoplegia (with the eyes fixed in a hypo- and exotropic position), to mild asymptomatic restrictions of ocular movement. Ptosis, refractive error, amblyopia, and compensatory head positions are associated with the more severe forms of the disorder. In some cases, this ocular phenotype is accompanied by additional features including developmental delay, corpus callosum agenesis, basal ganglia dysmorphism, facial weakness, polyneuropathy. {ECO:0000269	PubMed:20074521}. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample

Dizi Analizi/ Sequence Analysis	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Leukemia, acute myelogenous (AML) [MIM:601626]: A subtype of acute leukemia, a cancer of the white blood cells. AML is a malignant disease of bone marrow characterized by maturational arrest of hematopoietic precursors at an early stage of development. Clonal expansion of myeloid blasts occurs in bone marrow, blood, and other tissue. Myelogenous leukemias develop from changes in cells that normally produce neutrophils, basophils, eosinophils and monocytes. (ECO:0000269|PubMed:11090077, ECO:0000269|PubMed:11290608, ECO:0000269|PubMed:11442493, ECO:0000269|PubMed:14504097, ECO:0000269|PubMed:16266983, ECO:0000269|PubMed:18305215, ECO:0000269|PubMed:8946930, ECO:0000269|PubMed:9737679). Note=The gene represented in this entry may be involved in disease pathogenesis. Somatic mutations that lead to constitutive activation of FLT3 are frequent in AML patients. These mutations fall into two classes, the most common being in-frame internal tandem duplications of variable length in the juxtamembrane region that disrupt the normal regulation of the kinase activity. Likewise, point mutations in the activation loop of the kinase domain can result in a constitutively activated kinase.;	EDTA Blood Sample
FMF (Ailevi Akdeniz Ateşi) (Sık Görülen 12 Mutasyon) (MEFV geni) (Dizi Analizi) (Postnatal)	FMF (Familial Mediterranean Fever) (12 frequent mutations) (MEFV gene) (Dizi Analizi) (Postnatal)	MEFV	. It also can metastasize to other parts of the body. The term gastric cancer or gastric carcinoma refers to adenocarcinoma of the stomach that accounts for most of all gastric malignant tumors. Two main histologic types are recognized, diffuse type and intestinal type carcinomas. Diffuse tumors are poorly differentiated infiltrating lesions, resulting in thickening of the stomach. In contrast, intestinal tumors are usually exophytic, often ulcerating, and associated with intestinal metaplasia of the stomach, most often observed in sporadic disease. {ECO:0000269|PubMed:10395827, ECO:0000269|PubMed:9679752}. They are histologically, immunohistochemically, and genetically different from typical leiomyomas, leiomyosarcomas, and schwannomas. Most GISTs are composed of a fairly uniform population of spindle-shaped cells. Some tumors are dominated by epithelioid cells or contain a mixture of spindle and epithelioid morphologies. Primary GISTs in the gastrointestinal tract commonly metastasize in the omentum and mesenteries, often as multiple nodules. However, primary tumors may also occur outside of the gastrointestinal tract, in other intra-abdominal locations, especially in the omentum and mesentery. {ECO:0000269|PubMed:12522257, ECO:0000269|PubMed:15928335}. Note=The gene represented in this entry may be involved in disease pathogenesis. Mutations causing PDGFRA-constitutive activation have been found in gastrointestinal stromal tumors lacking KIT mutations (PubMed:12522257). {ECO:0000269|PubMed:12522257},. Radiologic features include delayed bone age, cone-shaped epiphyses, shortened long tubular bones, and ovoid vertebral bodies. Affected individuals have characteristic facial features including a 'happy' face with full cheeks, shortened nose, hypertelorism, long and flat philtrum, and thin upper lip. Other distinctive features include progressive cardiac valvular thickening often leading to an early death, toe walking, tracheal stenosis, respiratory insufficiency, and lysosomal-like storage vacuoles in various tissues. {ECO:0000269|PubMed:18677313, ECO:0000269|PubMed:21415077}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample

Dizi Analizi/ Sequence Analysis	Tümör dokusu (Taze ve ya etanol ile fikse) / Parafinize doku bloğu		30	120	.	.	60	Postnatal	DISEASE: Glioma (GLM) [MIM:137800]: Gliomas are benign or malignant central nervous system neoplasms derived from glial cells. They comprise astrocytomas and glioblastoma multiforme that are derived from astrocytes, oligodendrogliomas derived from oligodendrocytes and ependymomas derived from ependymocytes. {ECO:0000269|PubMed:19117336, ECO:0000269|PubMed:19935646}. Note=The gene represented in this entry is involved in disease pathogenesis. Mutations affecting Arg-132 are tissue-specific, and suggest that this residue plays a unique role in the development of high-grade gliomas. Mutations of Arg-132 to Cys, His, Leu or Ser abolish magnesium binding and abolish the conversion of isocitrate to alpha-ketoglutarate. Instead, alpha-ketoglutarate is converted to R(-)-2-hydroxyglutarate. Elevated levels of R(-)-2-hydroxyglutarate are correlated with an elevated risk of malignant brain tumors. {ECO:0000269|PubMed:19935646}.;	Tumor tissue (Fresh or etanol fixed) /Parafinized tissue sample

It is clinically characterized by hepatomegaly, hypoglycemia, short stature, and variable myopathy. Glycogen storage disease type 3 includes different forms: GSD type 3A patients lack glycogen debrancher enzyme activity in both liver and muscle, while GSD type 3B patients are enzyme-deficient in liver only. In rare cases, selective loss of only 1 of the 2 debranching activities, glucosidase or transferase, results in GSD type 3C or type 3D, respectively. {ECO:0000269|PubMed:10571954}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	Amniotic Fluid / CVS / Heparinized and EDTA (BOTH) Fetal Blood and Maternal EDTA Blood Sample

Glikojen Depo Hastalığı, Tip 9a1, 306000, X'e Bağlı (Glikojen Depo Hastalığı, Karaciğer Fosforilaz Kinaz Eksikliğine Bağlı) (PHKA2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Glycogen storage disease, type IXa1, 306000, X-linked recessive (Glycogen storage disease due to liver phosphorylase kinase deficiency) (PHKA2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	PHKA2	PHKA2, PHK, XLG, PHK, PYKL, GSD9A	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Glycogen storage disease 9A (GSD9A) [MIM:306000]: A metabolic disorder resulting in a mild liver glycogenosis with clinical symptoms that include hepatomegaly, growth retardation, muscle weakness, elevation of glutamate-pyruvate transaminase and glutamate-oxaloacetate transaminase, hypercholesterolemia, hypertriglyceridemia, and fasting hyperketosis. Two subtypes are known: type 1 or classic type with no phosphorylase kinase activity in liver or erythrocytes, and type 2 or variant type with no phosphorylase kinase activity in liver, but normal activity in erythrocytes. Unlike other glycogenosis diseases, glycogen storage disease type 9A is generally a benign condition. Patients improve with age and are often asymptomatic as adults. Accurate diagnosis is therefore also of prognostic interest. {ECO:0000269|PubMed:10330341, ECO:0000269|PubMed:17689125, ECO:0000269|PubMed:7549948, ECO:0000269|PubMed:7847371, ECO:0000269|PubMed:8733133, ECO:0000269|PubMed:8733134, ECO:0000269|PubMed:9600238}. Hemolitik Anemi, G6PD Eksikliğine Bağlı, 300908, X'e Bağlı Resesif (Sınıf 1 Glukoz-6-Fosfat Dehidrogenaz Eksikliği) (G6PD gen) (Tüm Gen Dizi Analizi) (Postnatal)	Hemolytic anemia due to G6PD deficiency, 300908, X-linked recessive (Class I glucose-6-phosphate dehydrogenase deficiency) (G6PD gene) (Sequence Analysis-All Coding Exons) (Postnatal)	G6PD	G6PD, G6PD1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Anemia, non-spherocytic hemolytic, due to G6PD deficiency (NSHA) [MIM:300908]: A disease characterized by G6PD deficiency, acute hemolytic anemia, fatigue, back pain, and jaundice. In most patients, the disease is triggered by an exogenous agent, such as some drugs, food, or infection. Increased unconjugated bilirubin, lactate dehydrogenase, and reticulocytosis are markers of the disorder. Although G6PD deficiency can be life-threatening, most patients are asymptomatic throughout their life. (ECO:0000269	PubMed:1611091). Note=The disease is caused by mutations affecting the gene represented in this entry. Deficiency of G6PD is associated with hemolytic anemia in two different situations. First, in areas in which malaria has been endemic, G6PD-deficiency alleles have reached high frequencies (1% to 50%) and deficient individuals, though essentially asymptomatic in the steady state, have a high risk of acute hemolytic attacks. Secondly, sporadic cases of G6PD deficiency occur at a very low frequencies, and they usually present a more severe phenotype. Several types of NSHA are recognized. Class-I variants are associated with severe NSHA; class-II have an activity <10% of normal; class-III have an activity of 10% to 60% of normal; class- IV have near normal activity.;	EDTA Blood Sample

Characteristic microscopic features include lobulated sheets of histiocyte-like cells intimately associated with areas of hemorrhage and cystic pseudovascular spaces, as well as a striking cuffing of inflammatory cells, mimicking a lymph node metastasis. Note=The gene represented in this entry may be involved in disease pathogenesis. A chromosomal aberration involving CREB1 is found in a patient with angiomatoid fibrous histiocytoma. Translocation t(2;22)(q33;q12) with CREB1 generates a EWSR1/CREB1 fusion gene that is most common genetic abnormality in this tumor type.	Tumor tissue (Fresh or etanol fixed) /Parafinized tissue sample

HIV Enfeksiyonu, Direnç, 609423 (CCL3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	HIV infection, resistance to, 609423 (CCL3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CCL3	CCL3, SCYA3, MIP1A	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
HIV Enfeksiyonu, Yatkınlık / Direnç (CCR2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	HIV infection, susceptibility/resistance to (CCR2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CCR2	CCR2, CMKBR2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
HIV Enfeksiyonu, Yatkınlık / Direnç (Hepatit C Antiviral Tedaviye Yanıt) (CCR5 geni) (Tüm Gen Dizi Analizi) (Postnatal)	HIV infection, susceptibility/resistance to (Response to antiviral treatment in hepatitis C) (CCR5 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CCR5	CCR5, CMKBR5, CCCKR5, IDDM22	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
HIV Tip 1, Yatkınlık, 609423 (CD209 geni) (Tüm Gen Dizi Analizi) (Postnatal)	HIV type 1, susceptibility to, 609423 (CD209 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CD209	CD209, CDSIGN	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
HIV-1 Hastalığı, Geciktirmeli Progresyon (CCL5 geni) (Tüm Gen Dizi Analizi) (Postnatal)	HIV-1 disease, delayed progression of (CCL5 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CCL5	CCL5, SCYA5, D17S136E, TCP228	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
HIV-1 Hastalığı, Hızlı İlerlemesi (CCL5 geni) (Tüm Gen Dizi Analizi) (Postnatal)	HIV-1 disease, rapid progression of (CCL5 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CCL5	CCL5, SCYA5, D17S136E, TCP228	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample

HIV-1 Viremi, Yatkınlık, 609423 (HLA-C gen) (Tüm Gen Dizi Analizi) (Postnatal)	HIV-1 viremia, susceptibility to, 609423 (HLA-C gene) (Sequence Analysis-All Coding Exons) (Postnatal)	HLA-C	HLA-C, PSORS1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
HIV-1, Direnç, 609423 (CCL2 gen) (Tüm Gen Dizi Analizi) (Postnatal)	HIV-1, resistance to, 609423 (CCL2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CCL2	CCL2, SCYA2, MCP1, MCAF	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
HIV-1, Yatkınlık, 609423 (IL10 gen) (Tüm Gen Dizi Analizi) (Postnatal)	HIV-1, susceptibility to, 609423 (IL10 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	IL10	IL10, CSIF, GVHDS	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
HIV / AIDS, Yatkınlık, 609423 (CCL3L1 gen) (Tüm Gen Dizi Analizi) (Postnatal)	HIV/AIDS, susceptibility to, 609423 (CCL3L1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CCL3L1	CCL3L1, SCYA3L1, LD78	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
HIV-1 Enfeksiyonu, Direnç, 609423 (TLR3 gen) (Tüm Gen Dizi Analizi) (Postnatal)	HIV1 infection, resistance to, 609423 (TLR3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TLR3	TLR3, IIAE2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
HIV-1, Direnç, 609423 (CCL11 gen) (Tüm Gen Dizi Analizi) (Postnatal)	HIV1, resistance to, 609423 (CCL11 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CCL11	CCL11, SCYA11	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
HLA B27 (HLA-B gen) (HLA Analizi/ HLA Analiysis) (Postnatal)	HLA B27 (HLA-B gene) (HLA Analizi/ HLA Analiysis) (Postnatal)	HLA-B	HLA-B, SPDA1	HLA Analizi/ HLA Analysis	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	.	EDTA Blood Sample
HLA B27 (HLA-B gen) (Real Time-PCR) (Postnatal)	HLA B27 (HLA-B gene) (Real Time-PCR) (Postnatal)	HLA-B	HLA-B, SPDA1	Real Time-PCR	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	.	EDTA Blood Sample
HLA B5 (HLA-B gen) (HLA Analizi/ HLA Analiysis) (Postnatal)	HLA B5 (HLA-B gene) (HLA Analizi/ HLA Analiysis) (Postnatal)	HLA-B	HLA-B, SPDA1	HLA Analizi/ HLA Analysis	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	.	EDTA Blood Sample
HLA B51 (HLA-B gen) (Real Time-PCR) (Postnatal)	HLA B51 (HLA-B gene) (Real Time-PCR) (Postnatal)	HLA-B	HLA-B, SPDA1	Real Time-PCR	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	.	EDTA Blood Sample
HLA B51 (HLA-B gen) (HLA Analizi/ HLA Analiysis) (Postnatal)	HLA B51 (HLA-B gene) (HLA Analizi/ HLA Analiysis) (Postnatal)	HLA-B	HLA-B, SPDA1	HLA Analizi/ HLA Analysis	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	.	EDTA Blood Sample
HMG-CoA Sentaz-2 Eksikliği, 605911; HMGCS2D (3-Hidroksi-3-Metilglutaril-CoA Sentaz 2 Eksikliği) (3-Hidroksi-3-Metilglutaril-CoA Sentaz Eksikliği) (HMGCS2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	HMG-CoA synthase-2 deficiency, 605911; HMGCS2D (3-hydroxy-3-methylglutaryl-CoA synthase 2 deficiency) (3-hydroxy-3-methylglutaryl-CoA synthase deficiency) (HMGCS2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	HMGCS2	HMGCS2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: 3-hydroxy-3-methylglutaryl-CoA synthase-2 deficiency (HMGCS2D) [MIM:605911]: A metabolic disorder characterized by severe hypoketotic hypoglycemia, encephalopathy, and hepatomegaly. {ECO:0000269|PubMed:11228257, ECO:0000269|PubMed:11479731, ECO:0000269|PubMed:12647205}. Hodgkin Lenfoma, Yatkınlık, 236000, Otozomal Resesif, CHL (Klasik Hodgkin Lenfoma) (KLHDC8B geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hodgkin lymphoma, susceptibility to, 236000, Autosomal recessive, CHL (Classic Hodgkin lymphoma) (KLHDC8B gene) (Sequence Analysis-All Coding Exons) (Postnatal)	KLHDC8B	KLHDC8B, CHL	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Lymphoma, Hodgkin, classic (CHL) [MIM:236000]: A malignant disease characterized by progressive enlargement of the lymph nodes, spleen and general lymphoid tissue, and the presence of large, usually multinucleate, cells (Reed-Sternberg cells). Reed-Sternberg cells compose only 1-2% of the total tumor cell mass. The remainder is composed of a variety of reactive, mixed inflammatory cells consisting of lymphocytes, plasma cells, neutrophils, eosinophils and histiocytes. {ECO:0000269|PubMed:19706467}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry. A variant in the 5'-UTR of KLHDC8B, responsible for decreasing its expression, is associated with classic Hodgkin lymphoma and segregates with the disease in some families (PubMed:19706467). {ECO:0000269|PubMed:19706467}.	EDTA Blood Sample
Holokarboksilaz Sentaz Eksikliği, 253270, Otozomal Resesif (Holokarboksilaz Sentetaz Eksikliği) (HLCS geni) (Tüm Gen Dizi Analizi) (Postnatal)	Holocarboxylase synthetase deficiency, 253270, Autosomal recessive (Holocarboxylase synthetase deficiency) (HLCS gene) (Sequence Analysis-All Coding Exons) (Postnatal)	HLCS	HLCS, HCS	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	. Onset of the disease occurs usually in the third or fourth decade of life. Onset and clinical course depend on the degree of poly-Gln repeat expansion, longer expansions resulting in earlier onset and more severe clinical manifestations. Neuropathology of Huntington disease displays a distinctive pattern with loss of neurons, especially in the caudate and putamen. Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample

The lesions appear as pearly papules or fleshy nodules. Additional features include gingival hypertrophy, progressive joint contractures resulting in severe limitation of mobility, osteopenia, and osteoporosis. Disease severity is variable. Some individuals manifest symptoms in infancy and have additional visceral or systemic involvement. Hyaline deposits in multiple organs, recurrent infections and intractable diarrhea often lead to early death. Surviving children may suffer from severely reduced mobility due to joint contractures. Other patients have later onset of a milder disorder affecting only the face and digits. {ECO:0000269|PubMed:12973667, ECO:0000269|PubMed:14508707, ECO:0000269|PubMed:15725249). It is characterized biochemically by lifelong elevation of serum calcium concentrations and is associated with inappropriately low urinary calcium excretion and a normal or mildly elevated circulating parathyroid hormone level. Hypermagnesemia is typically present. Affected individuals are usually asymptomatic and the disorder is considered benign. However, chondrocalcinosis and pancreatitis occur in some adults. {ECO:0000269|PubMed:11762699, ECO:0000269|PubMed:15572418, ECO:0000269|PubMed:15579740, ECO:0000269|PubMed:15879434, ECO:0000269|PubMed:16598859, ECO:0000269|PubMed:17473068, ECO:0000269|PubMed:17698911, ECO:0000269|PubMed:21643651, ECO:0000269|PubMed:7673400, ECO:0000269|PubMed:7726161, ECO:0000269|PubMed:7916660, ECO:0000269|PubMed:9298824). They are histologically, immunohistochemically, and genetically different from typical leiomyomas, leiomyosarcomas, and schwannomas. Most GISTs are composed of a fairly uniform population of spindle-shaped cells. Some tumors are dominated by epithelioid cells or contain a mixture of spindle and epithelioid morphologies. Primary GISTs in the gastrointestinal tract commonly metastasize in the omentum and mesenteries, often as multiple nodules. However, primary tumors may also occur outside of the gastrointestinal tract, in other intra-abdominal locations, especially in the omentum and mesentery. (ECO:0000269|PubMed:12522257, ECO:0000269|PubMed:15928335). Note=The gene represented in this entry may be involved in disease pathogenesis. Mutations causing PDGFRA constitutive activation have been found in gastrointestinal stromal tumors lacking KIT mutations (PubMed:12522257). (ECO:0000269|PubMed:12522257).;	Tumor tissue (Fresh or etanol fixed) /Parafinized tissue sample

Hipertansiyon, Esansiyel, Yatkınlık, 145500, Multifaktöryel (ECE1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypertension, essential, susceptibility to, 145500, Multifactorial (ECE1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ECE1	ECE1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
Hipertansiyon, Esansiyel, Yatkınlık, 145500, Multifaktöryel (AGT geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypertension, essential, susceptibility to, 145500, Multifactorial (AGT gene) (Sequence Analysis-All Coding Exons) (Postnatal)	AGT	AGT, SERPINA8	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Essential hypertension (EHT) [MIM:145500]: A condition in which blood pressure is consistently higher than normal with no identifiable cause. (ECO:0000269|PubMed:1394429, ECO:0000269|PubMed:8513325). Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.	EDTA Blood Sample
Hipertansiyon, İnsülin Direnci İle İlgili, Yatkınlık, 125853, Otozomal Dominant (RETN geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypertension, insulin resistance-related, susceptibility to, 125853, Autosomal dominant (RETN gene) (Sequence Analysis-All Coding Exons) (Postnatal)	RETN	RETN, RSTN, FIZ73	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
Hypertension, Pregnancy Induced, 189800, Otozomal Dominant (Preeklampsi) (NOS3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypertension, pregnancy-induced, 189800, Autosomal dominant (Preeclampsia) (NOS3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NOS3	NOS3	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=Variation in NOS3 seem to be associated with susceptibility to coronary spasm. (ECO:0000269|PubMed:11740345, ECO:0000269|PubMed:9737779).	EDTA Blood Sample
Hipertansiyon, Tuza Dirençli (NPR3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypertension, salt-resistant (NPR3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NPR3	NPR3, ANPRC	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
Hipertansiyon, Tuza Karşı Duyarlı Esansiyel Yatkınlık, 145500, Multifaktöryel (CYP3A5 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypertension, salt-sensitive essential, susceptibility to, 145500, Multifactorial (CYP3A5 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CYP3A5	CYP3A5, P450PCN3	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
Hipertansiyon, Tuza Karşı Duyarlı Esansiyel Yatkınlık, 145500, Multifaktöryel (MLPA)	Hypertension, salt-sensitive essential, susceptibility to, 145500, Multifactorial (MLPA)	CYP3A5	CYP3A5, P450PCN3	MLPA (CNV)	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	.	EDTA Blood Sample
Hipertansiyon, Yatkınlık, 145500, Multifaktöryel (NOS3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypertension, susceptibility to, 145500, Multifactorial (NOS3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NOS3	NOS3	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Note=Variation in NOS3 seem to be associated with susceptibility to coronary spasm. (ECO:0000269|PubMed:11740345, ECO:0000269|PubMed:9737779).	EDTA Blood Sample
Hipertansiyon, Yatkınlık, 145500, Multifaktöryel (NOS2 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypertension, susceptibility to, 145500, Multifactorial (NOS2 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	NOS2	NOS2A, NOS2	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample
Hipertiroidizm, Ailesel Gestasyonel, 603373 (Ailesel Gestasyonel Hipertiroidizm) (TSHR geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hyperthyroidism, familial gestational, 603373 (Familial gestational hyperthyroidism) (TSHR gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TSHR	TSHR, CHNG1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypothyroidism, congenital, non-goitrous, 1 (CHNG1) [MIM:275200]: A non-autoimmune condition characterized by resistance to thyroid-stimulating hormone (TSH) leading to increased levels of plasma TSH and low levels of thyroid hormone. It presents variable severity depending on the completeness of the defect. Most patients are euthyroid and asymptomatic, with a normal sized thyroid gland. Only a subset of patients develop hypothyroidism and present a hypoplastic thyroid gland. (ECO:0000269|PubMed:10720030, ECO:0000269|PubMed:11095460, ECO:0000269|PubMed:11442002, ECO:0000269|PubMed:12050212, ECO:0000269|PubMed:14725684, ECO:0000269|PubMed:15531543, ECO:0000269|PubMed:7528344, ECO:0000269|PubMed:8954020, ECO:0000269|PubMed:9100579, ECO:0000269|PubMed:9185526, ECO:0000269|PubMed:9329388). Note=The disease is caused by mutations affecting the gene represented in this entry.	EDTA Blood Sample

Hipertiroidizm, Allesel Gestasyonel, 603373 (Allesel Gestasyonel Hipertiroidizm) (MLPA)	Hyperthyroidism, familial gestational, 603373 (Familial gestational hyperthyroidism) (MLPA)	TSHR	TSHR, CHNG1	MLPA (CNV)	EDTA'lı Kan (2-4 ml)		20	60	.	.	30	Postnatal	DISEASE: Hypothyroidism, congenital, non-goitrous, 1 (CHNG1) [MIM:275200]: A non-autoimmune condition characterized by resistance to thyroid-stimulating hormone (TSH) leading to increased levels of plasma TSH and low levels of thyroid hormone. It presents variable severity depending on the completeness of the defect. Most patients are euthyroid and asymptomatic, with a normal sized thyroid gland. Hipertrikoz, Konjenital Jeneralize, 307150, X'e Bağlı Dominant (Hipertrikozis Lanuginosa Konjenital (2200)	Hypertrichosis, congenital generalized, 307150, X-linked dominant (Hypertrichosis lanuginosa congenita) (440)	Array-CGH	HTC2, HCG, CGH, CXINSp27.1,	Array-CGH	EDTA'lı Kan (2-4 ml) ve Heparinli Kan (2-4 ml)		30	120	.	.	60	Postnatal	.	EDTA Blood Sample and Heparinized blood sample
Hipertrikotik Osteokondrodisplazi, 239850, Otozomal Dominant (Hipertrikotik Osteokondrodisplazi, Cantu Tipi) (ABCC9 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypertrichotic osteochondrodysplasia, 239850, Autosomal dominant (Hypertrichotic osteochondrodysplasia, Cantu type) (ABCC9 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ABCC9	ABCC9, SUR2, CMD1O, ATFB12, CANTU	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Hypertrichotic osteochondrodysplasia (HTOCD) [MIM:239850]: A rare disorder characterized by congenital hypertrichosis, neonatal macrosomia, a distinct osteochondrodysplasia, and cardiomegaly. The hypertrichosis leads to thick scalp hair, which extends onto the forehead, and a general increase in body hair. In addition, macrocephaly and coarse facial features, including a broad nasal bridge, epicanthal folds, a wide mouth, and full lips, can be suggestive of a storage disorder. About half of affected individuals are macrosomic and edematous at birth, whereas in childhood they usually have a muscular appearance with little subcutaneous fat. Thickened calvarium, narrow thorax, wide ribs, flattened or ovoid vertebral bodies, coxa valga, osteopenia, enlarged medullary canals, and metaphyseal widening of long bones have been reported. Cardiac manifestations such as patent ductus arteriosus, ventricular hypertrophy, pulmonary hypertension, and pericardial effusions are present in approximately 80% of cases. Motor development is usually delayed due to hypotonia. Most patients have a mild speech delay, and a small percentage have learning difficulties or intellectual disability. {ECO:0000269|PubMed:22608503, ECO:0000269|PubMed:22610116}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample

It is characterized by the triad of chronic bronchopulmonary disease (with recurrent respiratory infections), pancreatic insufficiency (which leads to malabsorption and growth retardation) and elevated sweat electrolytes. It is the most common genetic disease in Caucasians, with a prevalence of about 1 in 2'000 live births. Inheritance is autosomal recessive. Hipogonadotropik Hipogonadizm 1, ± Anozmi (Kallmann Sendromu 1) 308700, X'e Bağlı; HH1 (Kallmann Sendromu) (ANOS1 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypogonadotropic hypogonadism 1 with or without anosmia (Kallmann syndrome 1), 308700, X-linked; HH1 (Kallmann syndrome) (ANOS1 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	ANOS1	KAL1, KMS, ADMLX, HH1	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	60	Postnatal	DISEASE: Hypogonadotropic hypogonadism 1 with or without anosmia (HH1) [MIM:308700]: A disorder characterized by absent or incomplete sexual maturation by the age of 18 years, in conjunction with low levels of circulating gonadotropins and testosterone and no other abnormalities of the hypothalamic-pituitary axis. In some cases, it is associated with non-reproductive phenotypes, such as anosmia, cleft palate, and sensorineural hearing loss. Anosmia or hyposmia is related to the absence or hypoplasia of the olfactory bulbs and tracts. Hypogonadism is due to deficiency in gonadotropin-releasing hormone and probably results from a failure of embryonic migration of gonadotropin-releasing hormone-synthesizing neurons. In the presence of anosmia, idiopathic hypogonadotropic hypogonadism is referred to as Kallmann syndrome, whereas in the presence of a normal sense of smell, it has been termed normosmic idiopathic hypogonadotropic hypogonadism (nHH). {ECO:0000269|PubMed:11297579, ECO:0000269|PubMed:15001591, ECO:0000269|PubMed:15605412, ECO:0000269|PubMed:17054399, ECO:0000269|PubMed:17213338, ECO:0000269|PubMed:17223984, ECO:0000269|PubMed:20530987, ECO:0000269|PubMed:21168128, ECO:0000269|PubMed:23643382, ECO:0000269|PubMed:25077900, ECO:0000269|PubMed:8504298, ECO:0000269|PubMed:8989261, ECO:0000269|PubMed:9589672}. Note=The disease is caused by mutations affecting distinct genetic loci, including the gene represented in this entry. The genetics of hypogonadotropic hypogonadism involves various modes of transmission.	EDTA Blood Sample
Hipogonadotropik Hipogonadizm 10, ± Anozmi, 614839, Otozomal Resesif; HH10 (Normozmik Konjenital Hipogonadotropik Hipogonadizm) (TAC3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypogonadotropic hypogonadism 10 with or without anosmia, 614839, Autosomal recessive; HH10 (Normosmic congenital hypogonadotropic hypogonadism) (TAC3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TAC3	TAC3, NKNB, HH10	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	60	Postnatal	DISEASE: Hypogonadotropic hypogonadism 10 with or without anosmia (HH10) [MIM:614839]: A disorder characterized by absent or incomplete sexual maturation by the age of 18 years, in conjunction with low levels of circulating gonadotropins and testosterone and no other abnormalities of the hypothalamic-pituitary axis. Hypogonadism is due to deficiency in gonadotropin-releasing hormone and probably results from a failure of embryonic migration of gonadotropin-releasing hormone-synthesizing neurons. In the presence of anosmia, idiopathic hypogonadotropic hypogonadism is referred to as Kallmann syndrome, whereas in the presence of a normal sense of smell, it has been termed normosmic idiopathic hypogonadotropic hypogonadism (nHH). {ECO:0000269	PubMed:19079066, ECO:0000269	PubMed:23643382}. Note=The disease is caused by mutations affecting the gene represented in this entry.;	EDTA Blood Sample
Hipogonadotropik Hipogonadizm 11, ± Anozmi, 614840, Otozomal Resesif; HH11 (Kallmann Sendromu) (TACR3 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypogonadotropic hypogonadism 11 with or without anosmia, 614840, Autosomal recessive; HH11 (Kallmann syndrome) (TACR3 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	TACR3	TACR3, NK3R, HH11	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	60	Postnatal	DISEASE: Hypogonadotropic hypogonadism 11 with or without anosmia (HH11) [MIM:614840]: A disorder characterized by absent or incomplete sexual maturation by the age of 18 years, in conjunction with low levels of circulating gonadotropins and testosterone and no other abnormalities of the hypothalamic-pituitary axis. In some cases, it is associated with non-reproductive phenotypes, such as anosmia, cleft palate, and sensorineural hearing loss. Anosmia or hyposmia is related to the absence or hypoplasia of the olfactory bulbs and tracts. Hypogonadism is due to deficiency in gonadotropin-releasing hormone and probably results from a failure of embryonic migration of gonadotropin-releasing hormone-synthesizing neurons. In the presence of anosmia, idiopathic hypogonadotropic hypogonadism is referred to as Kallmann syndrome, whereas in the presence of a normal sense of smell, it has been termed normosmic idiopathic hypogonadotropic hypogonadism (nHH). {ECO:0000269|PubMed:19079066, ECO:0000269|PubMed:23643382, ECO:0000269|PubMed:25077900}. Note=The disease is caused by mutations affecting distinct genetic loci, including the gene represented in this entry. The genetics of hypogonadotropic hypogonadism involves various modes of transmission. Oligogenic inheritance has been reported in some patients carrying mutations in TACR3 as well as in other HH-associated genes including FGFR1, SPRY4 and KAL1 (PubMed:23643382). {ECO:0000269|PubMed:23643382}.. Anosmia or hyposmia is related to the absence or hypoplasia of the olfactory bulbs and tracts. Hypogonadism is due to deficiency in gonadotropin-releasing hormone and probably results from a failure of embryonic migration of gonadotropin-releasing hormone-synthesizing neurons. In the presence of anosmia, idiopathic hypogonadotropic hypogonadism is referred to as Kallmann syndrome, whereas in the presence of a normal sense of smell, it has been termed normosmic idiopathic hypogonadotropic hypogonadism (nlHH). {ECO:0000269|PubMed:17054399, ECO:0000269|PubMed:18559922, ECO:0000269|PubMed:23643382, ECO:0000269|PubMed:25077900}. Note=The disease is caused by mutations affecting distinct genetic loci, including the gene represented in this entry. The genetics of hypogonadotropic hypogonadism involves various modes of transmission. Oligogenic inheritance has been reported in some patients carrying mutations in PROK2 as well as in other HH- associated genes including PROKR2 (PubMed:23643382). {ECO:0000269|PubMed:23643382}.;	EDTA Blood Sample
Hipogonadotropik Hipogonadizm 5, ± Anozmi, 612370; HH5 (Kallmann Sendromu) (CHD7 geni) (Tüm Gen Dizi Analizi) (Postnatal)	Hypogonadotropic hypogonadism 5 with or without anosmia, 612370; HH5 (Kallmann syndrome) (CHD7 gene) (Sequence Analysis-All Coding Exons) (Postnatal)	CHD7	CHD7, HH5	Tüm Gen Dizi Analizi/ Sequence Analysis-All Coding Exons	EDTA'lı Kan (2-4 ml)		30	120	.	.	60	Postnatal	DISEASE: Idiopathic scoliosis 3 (IS3) [MIM:608765]: An abnormality of the vertebral column in which patients develop lateral curvature of the spine of at least 10 degrees. {ECO:0000269	PubMed:17436250}. Note=Disease susceptibility is associated with variations affecting the gene represented in this entry.	EDTA Blood Sample
